January 21, 2020

## Summary

Float showed a positive drift of the salinity data. The OWC corrections has been applied to the entire float 1-102;QC=2; error 0.005. There is no output from the OWC method in comparing to the CTD referenced data. Float has been compared with Argo reference data. Float need to be revisited after its death.

# 1 Introduction

Delayed mode analysis was performed for float number 360516i (3901879) where salinity and temperature values were separately compared to nearby historical CTD profiles and nearby Argo profiles as a reference database. The OWC (Cabanes et al., 2016) method was run to estimate a salinity offset and/or a salinity drift. For more information about float 360516i (3901879) click on the following link: <http://www.ifremer.fr/argoMonitoring/float/3901879>

## 2 Quality Check of Argo Float Data

### 2.1 Time Series of Vertical Distribution of Data

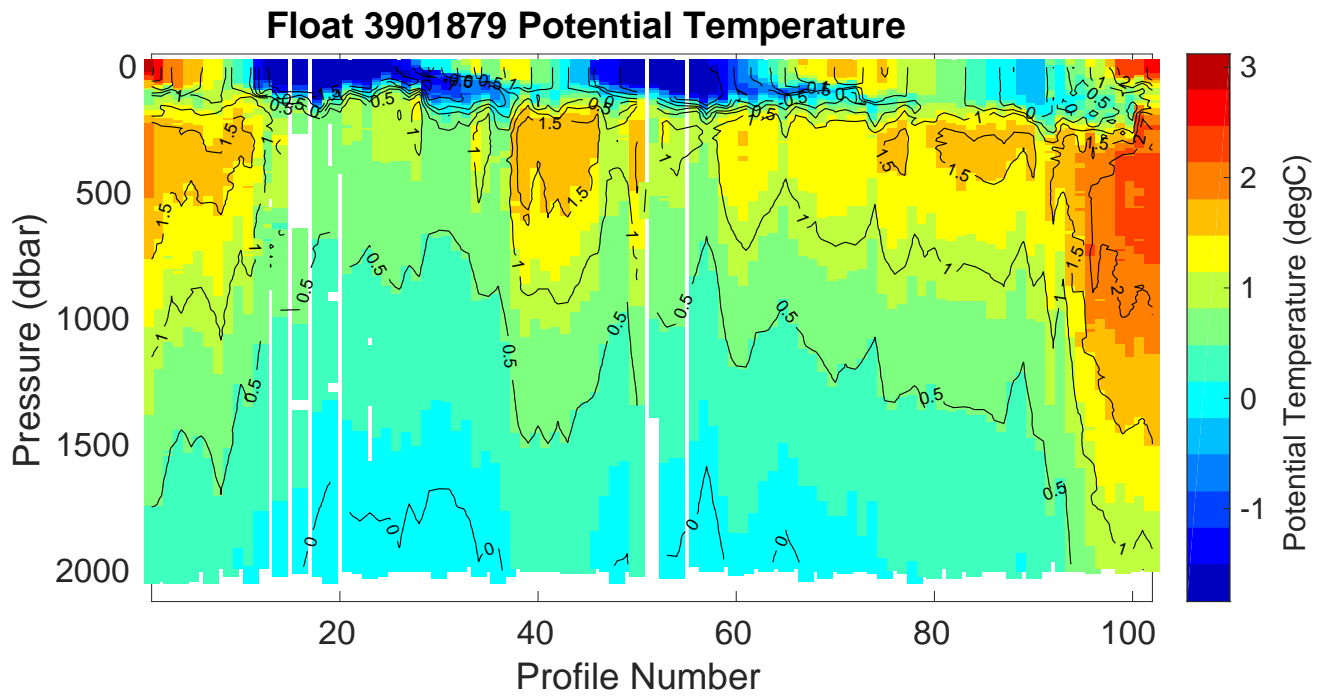

Figure 1: Float 3901879. Time series of the vertical distribution of potential temperature ( $^{\circ}\text{C}$ ).

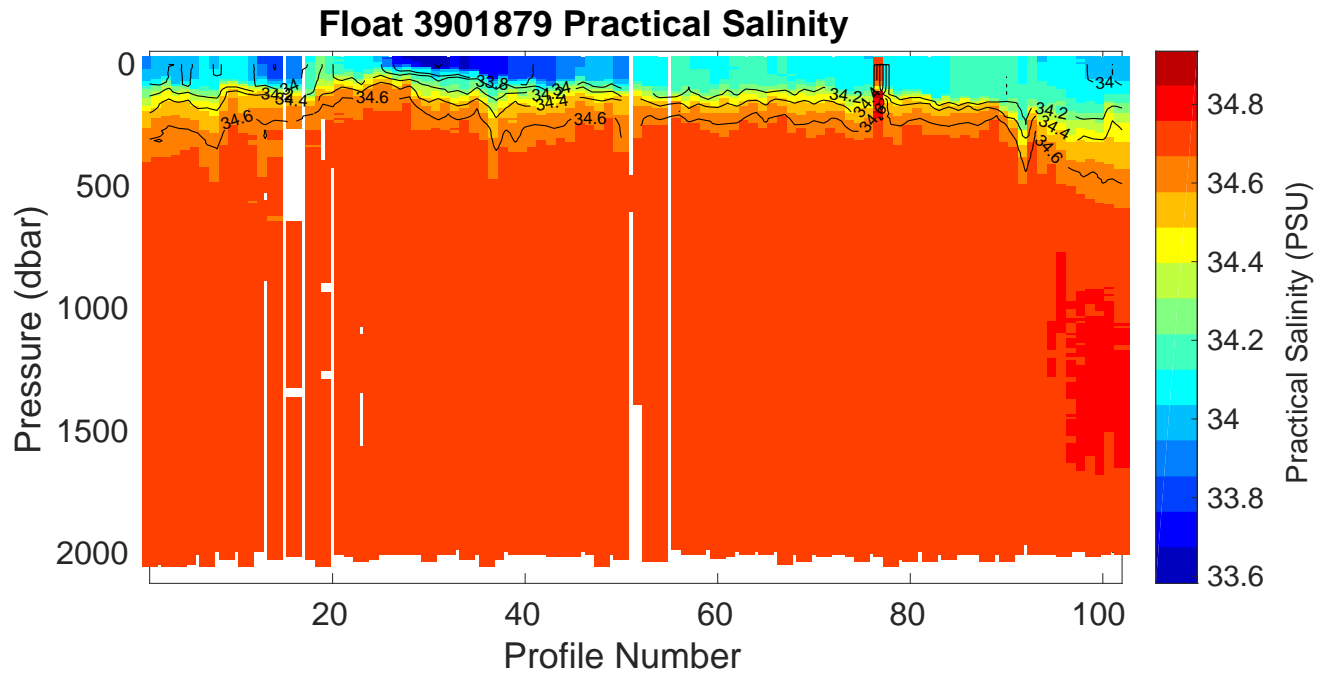

Figure 2: Float 3901879. Time series of the vertical distribution of practical salinity (PSU).

## 2.2 Comparison between Argo Float and Climatology

The comparison between float 3901879 and data from WMO boxes  $\pm 10^\circ$  of latitude and longitude shows that the Argo profiles fit within the expected ranges (Figures 3, 4 and 5). This result confirms that float 3901879 represents relatively stable and consistent with the expected physical conditions in this region.

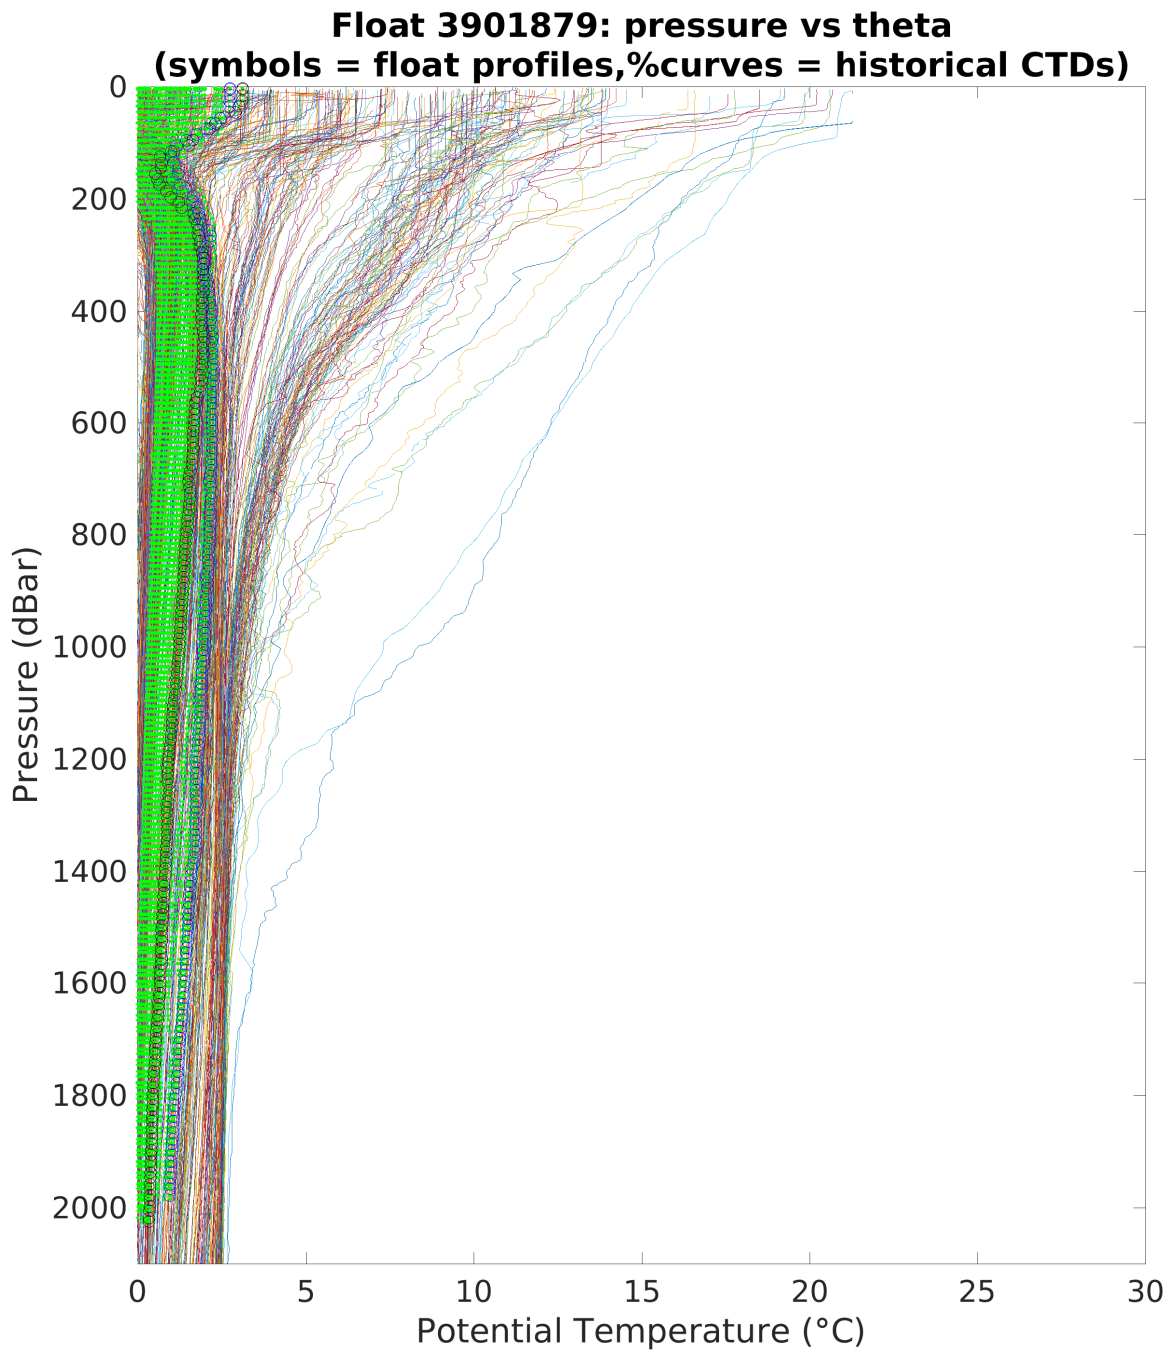

Figure 3: Float 3901879. Float profile of potential temperature (°C) plotted with climatology from the spatial range of 10°. The black and blue cycles indicates the first and the last Argo profile, respectively. Green symbols represent other Argo profiles.

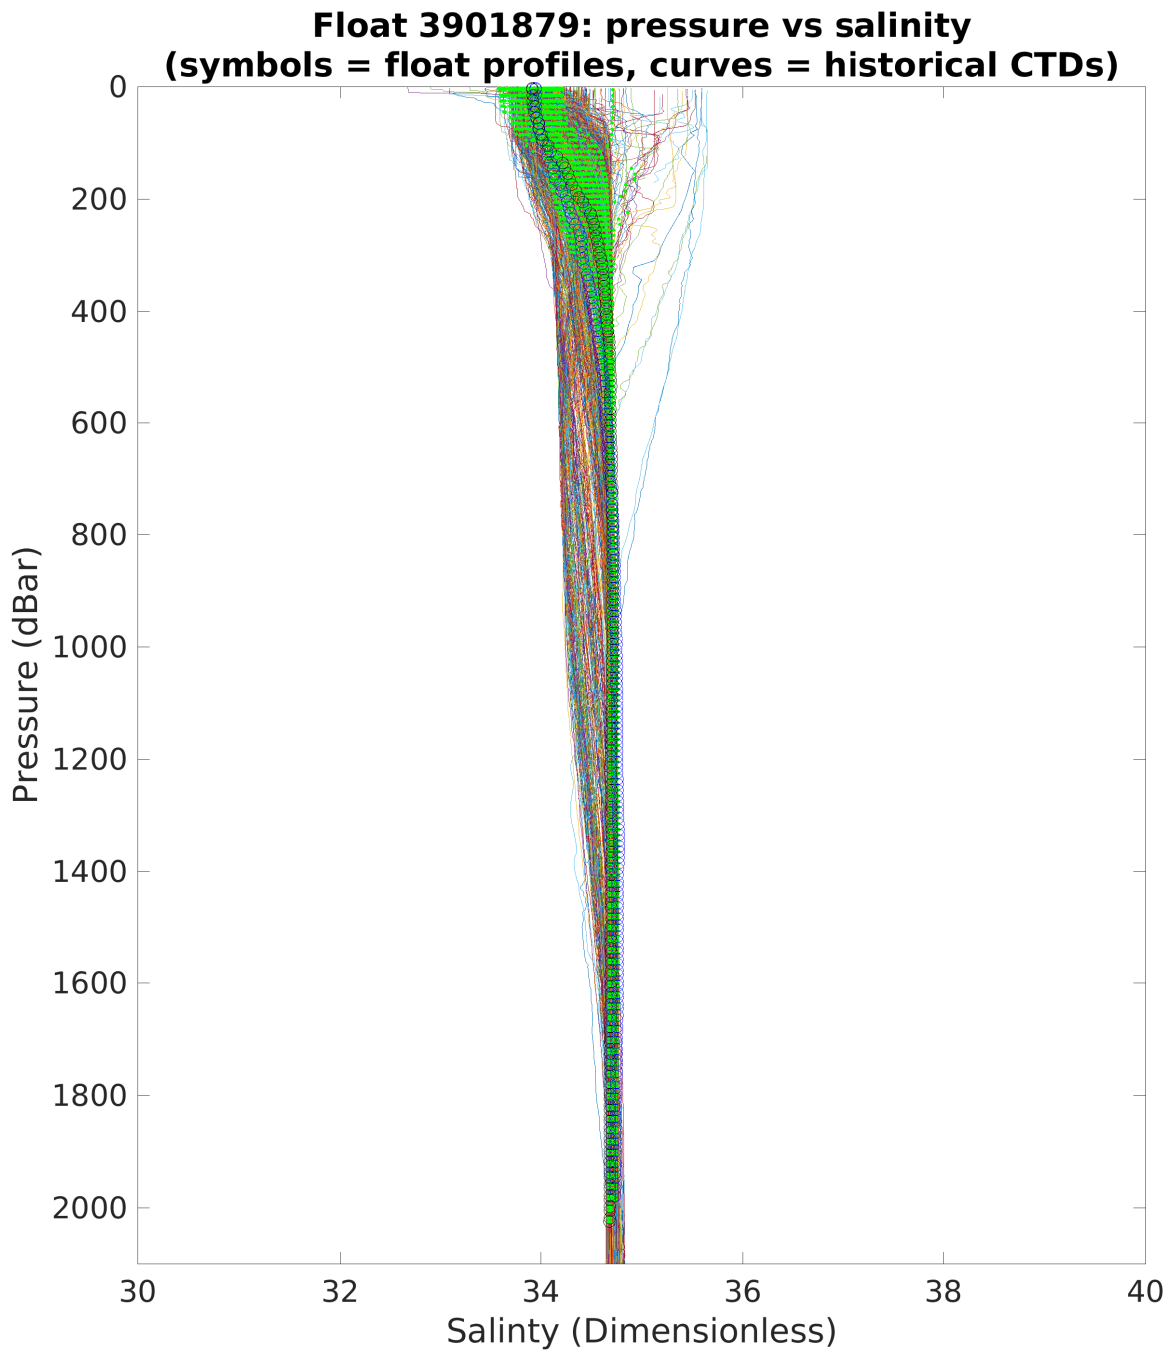

Figure 4: Float 3901879. Float profile of salinity (dimensionless) plotted with climatology from the spatial range of  $10^\circ$ . The black and blue cycles indicates the first and the last Argo profile, respectively. Green symbols represent other Argo profiles.

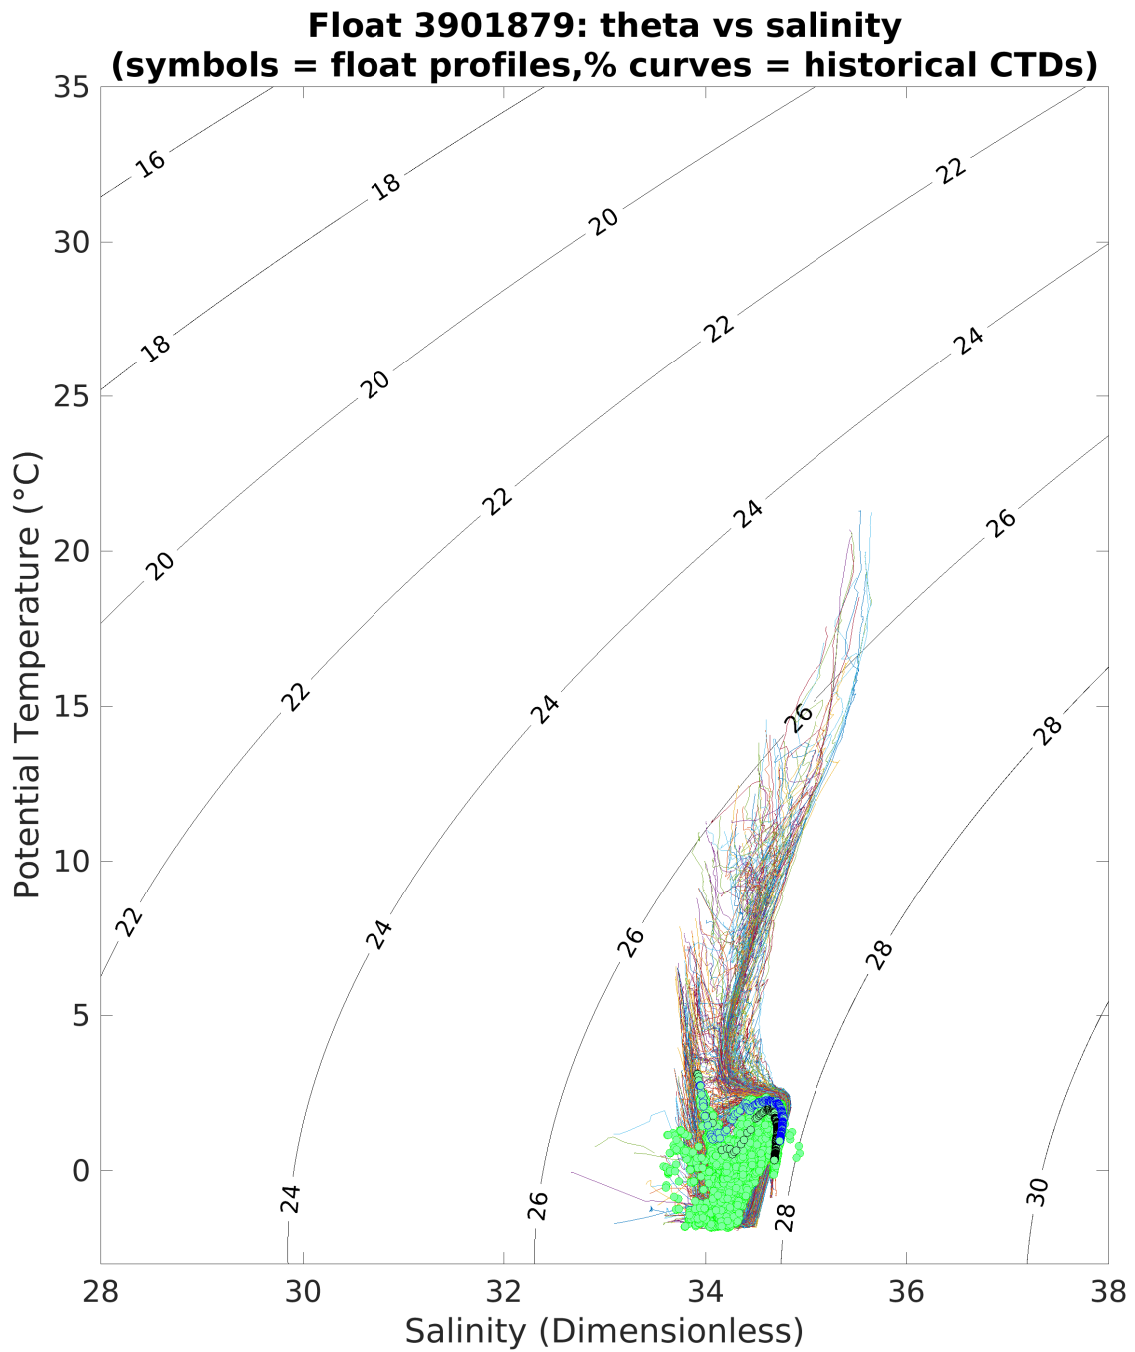

Figure 5: Float 3901879. Theta/S plotted with climatology from the spatial range of 10°. The black and blue circles indicate the first and the last Argo profile, respectively. Green symbols represent other Argo profiles.

**3901879 vertically-averaged salinity (PSS-78) additive correction**

**$\Delta S$  with errors**

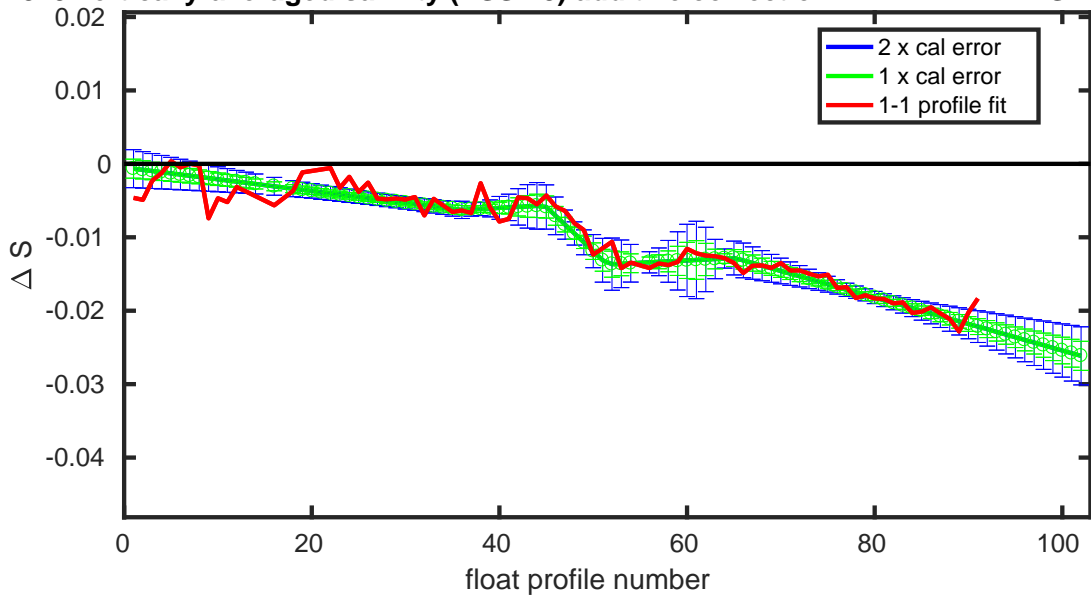

Figure 17: Float 3901879. Potential conductivity (top) and vertically averaged salinity (bottom) with errors.

3901879 calibrated float data (-) and mapped salinity (o) with objective errors

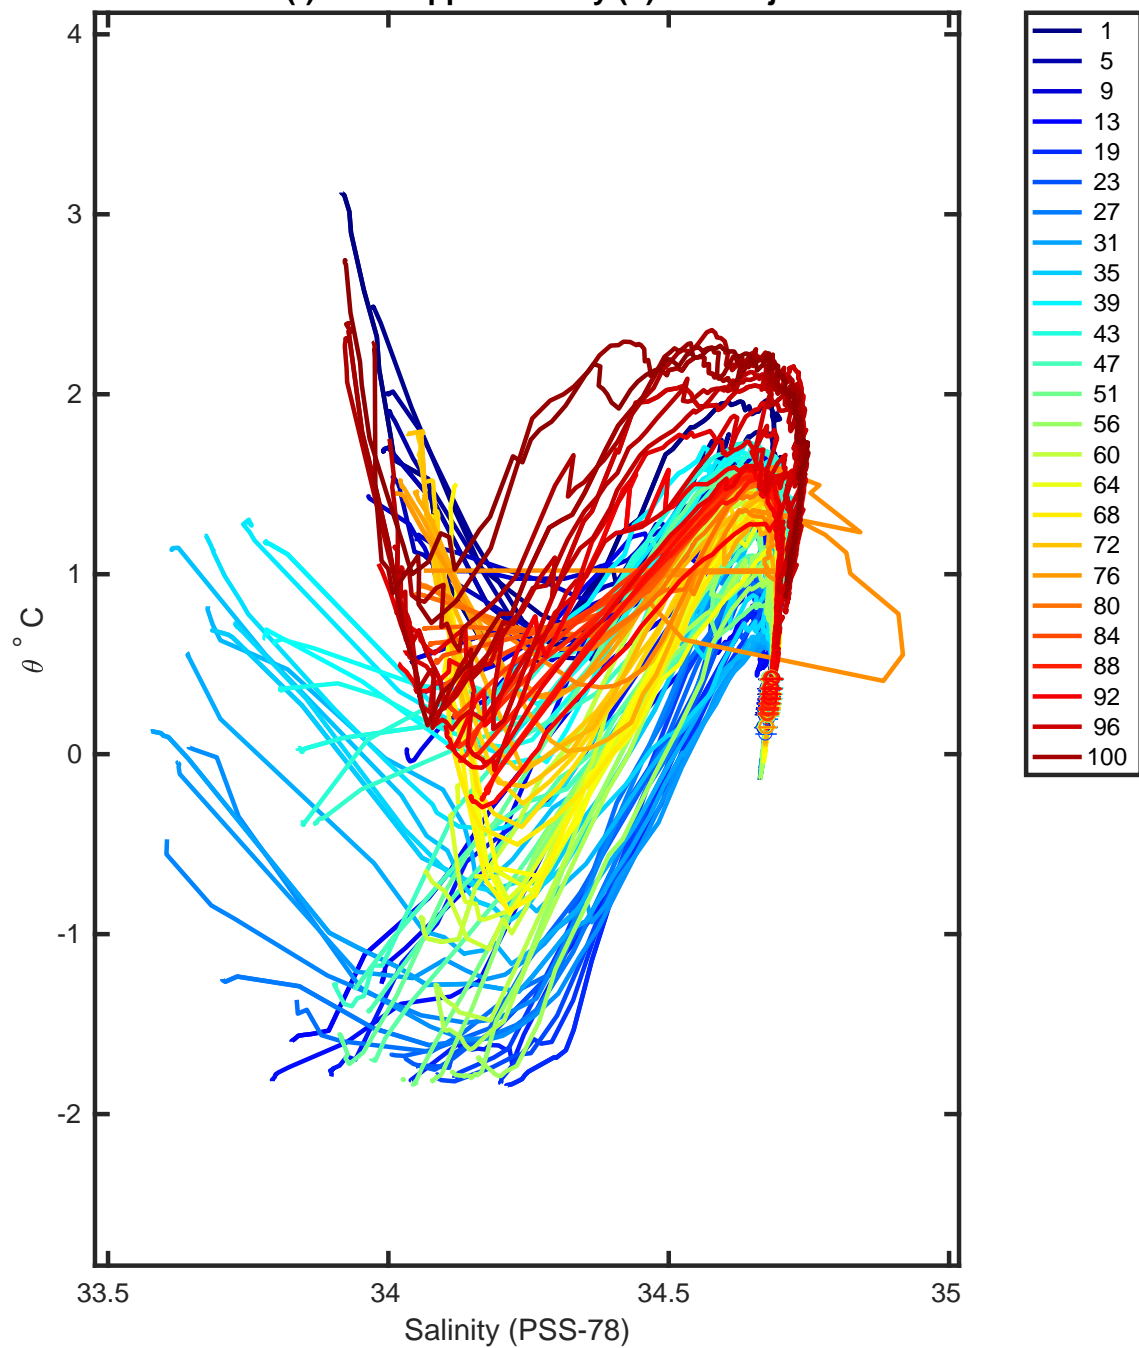

Figure 18: Float 3901879. Calibrated float data and mapped salinity.

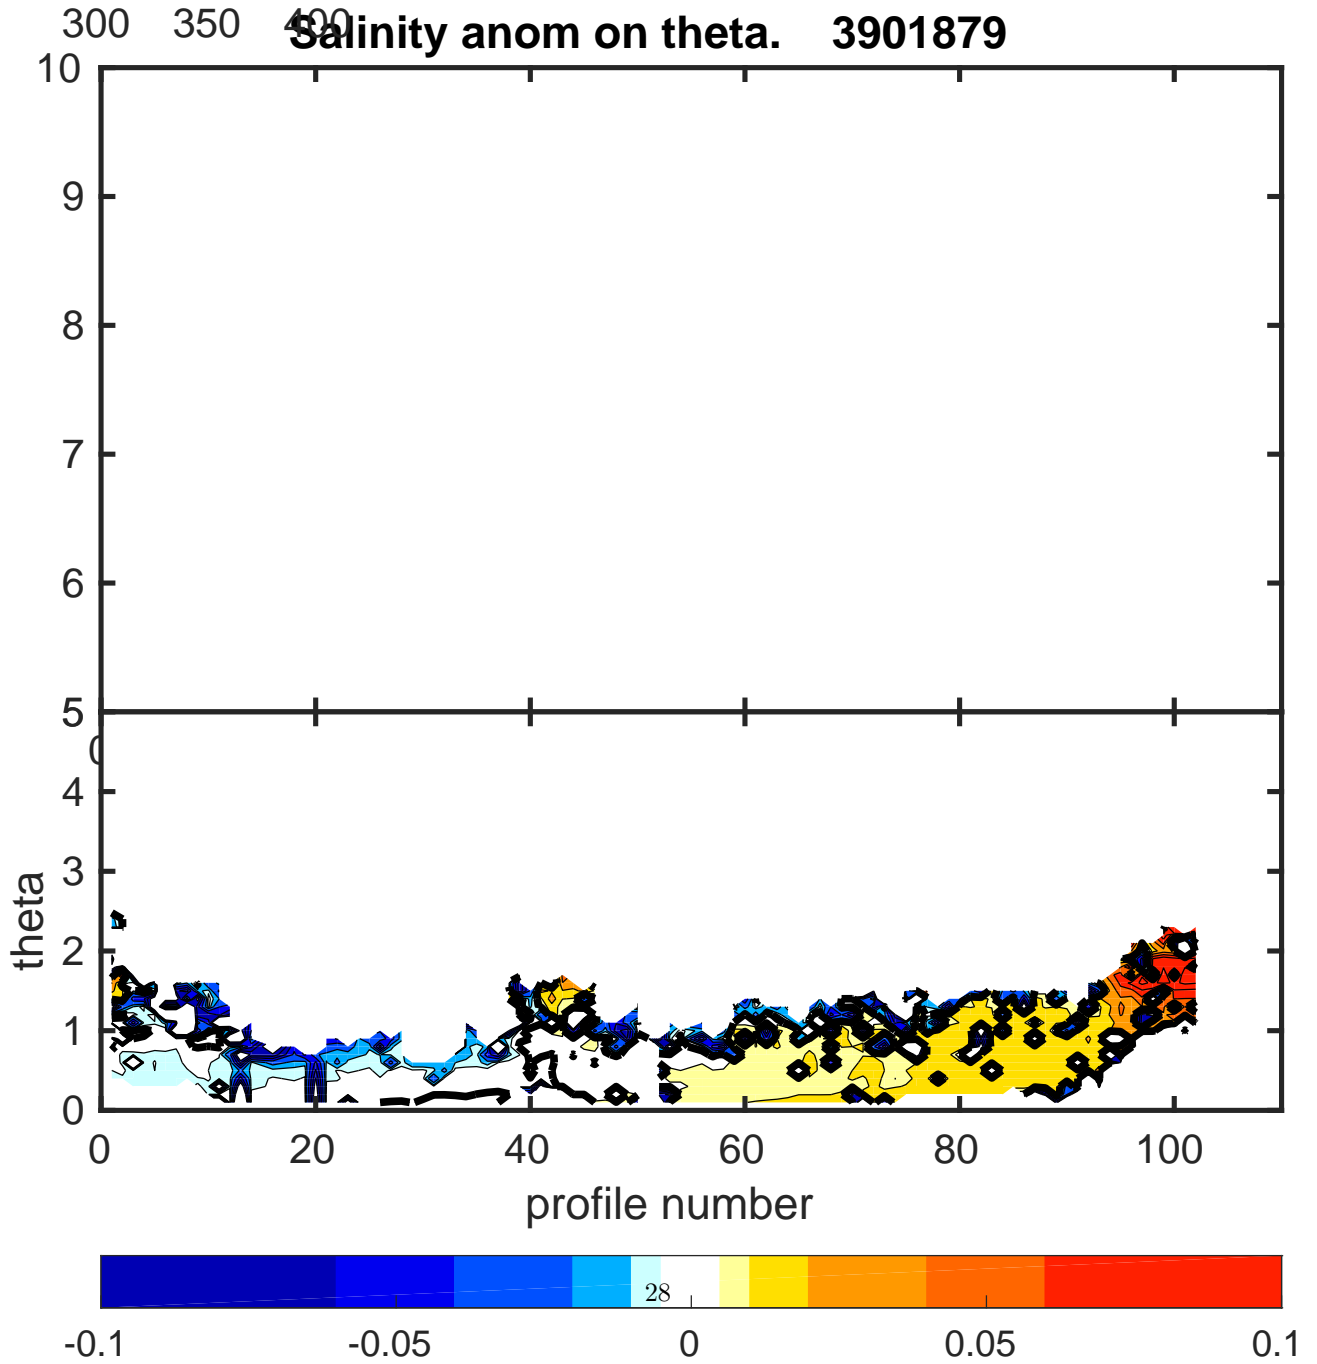

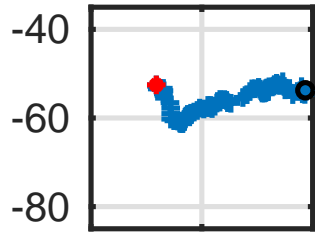

Figure 19: Float 3901879. Salinity anomaly on Theta

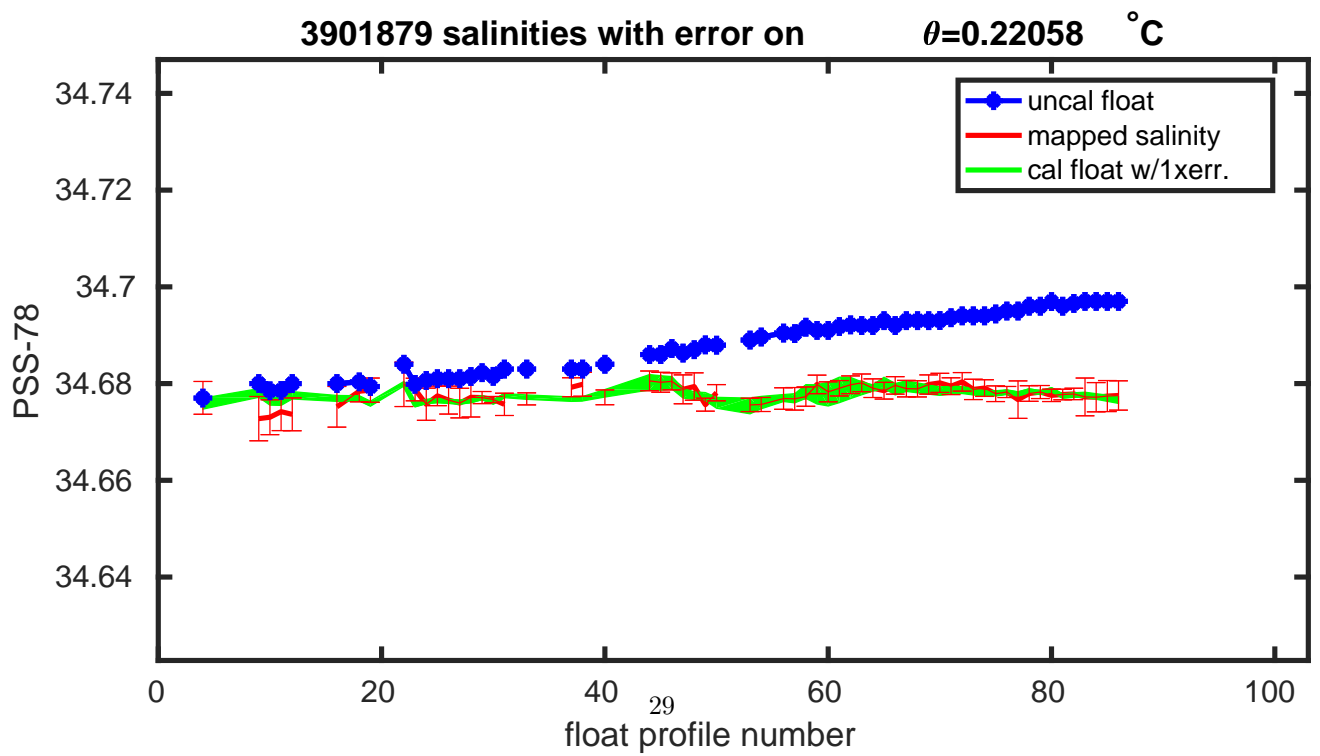

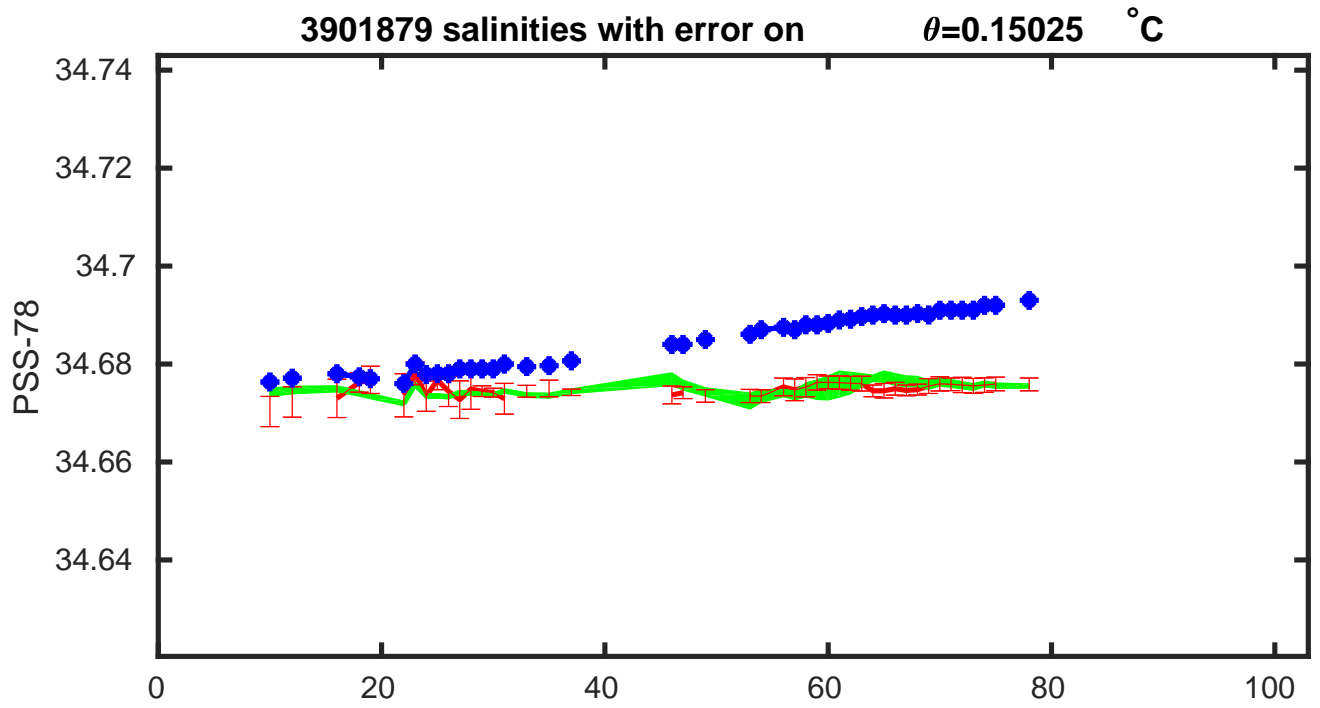

Figure 20: Float 3901879. Salinities with errors on  $\theta$ .

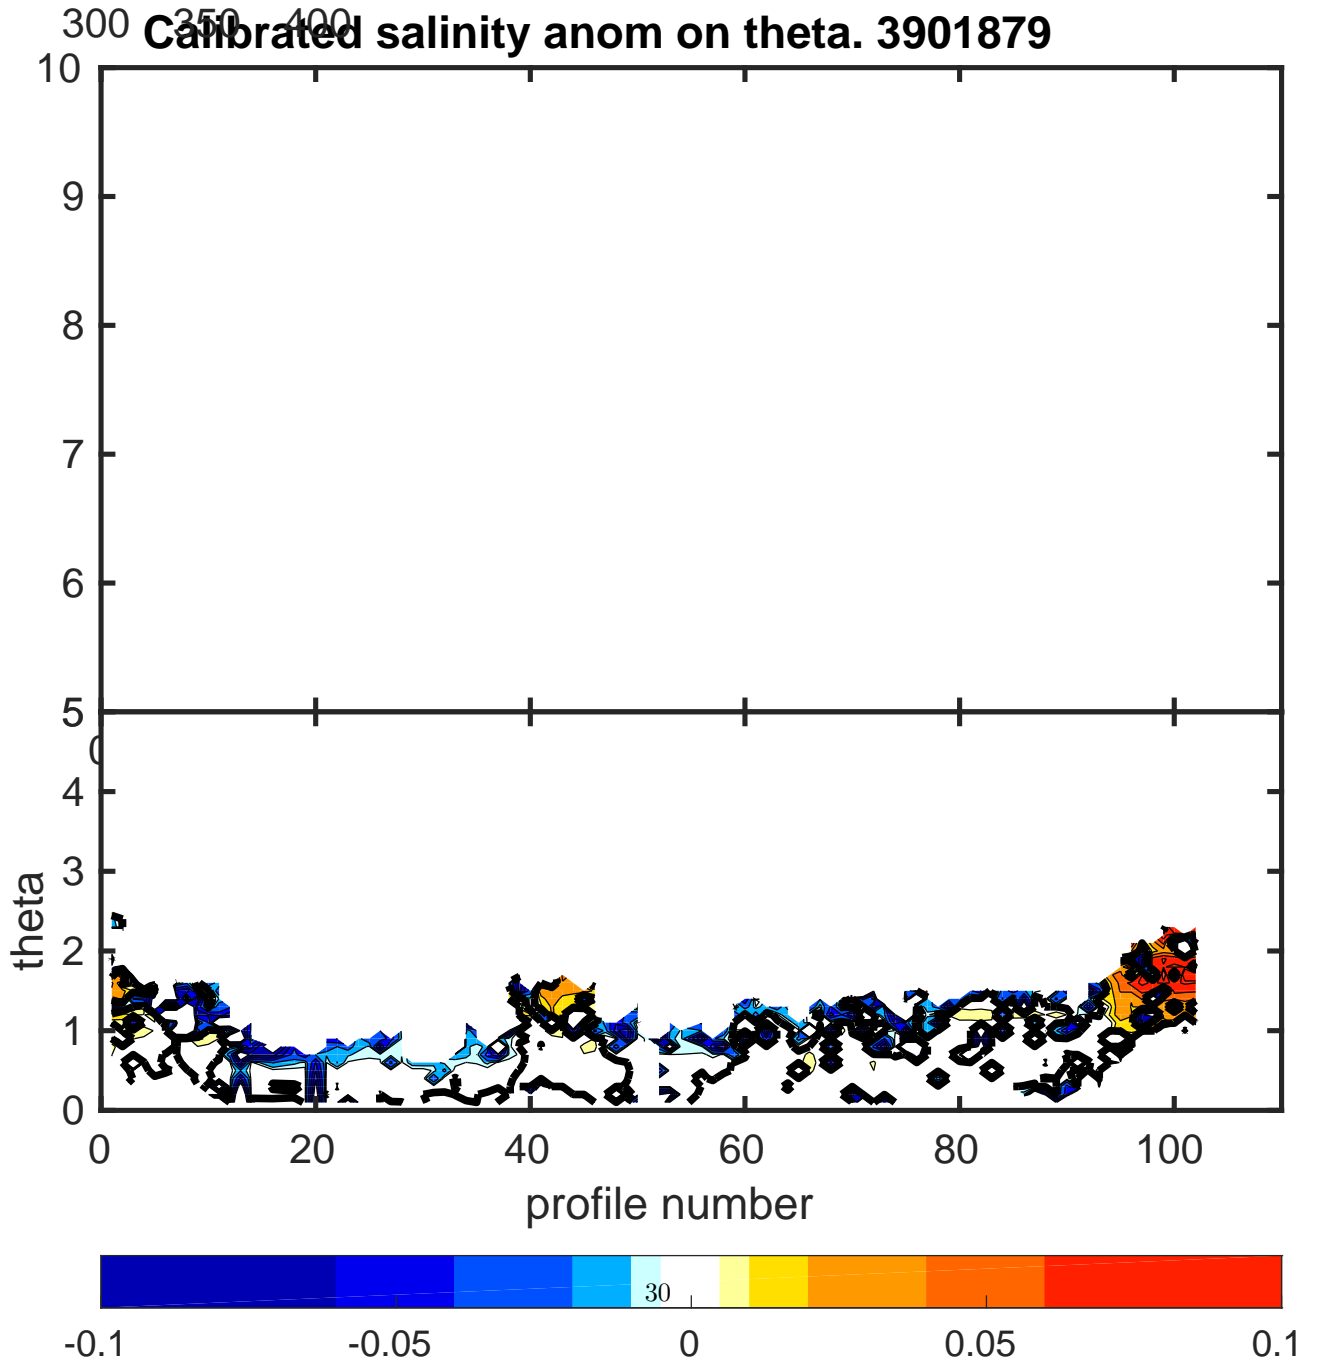

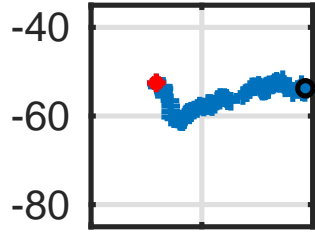

Figure 21: Float 3901879. Calibrated salinity anomaly on  $\theta$ .

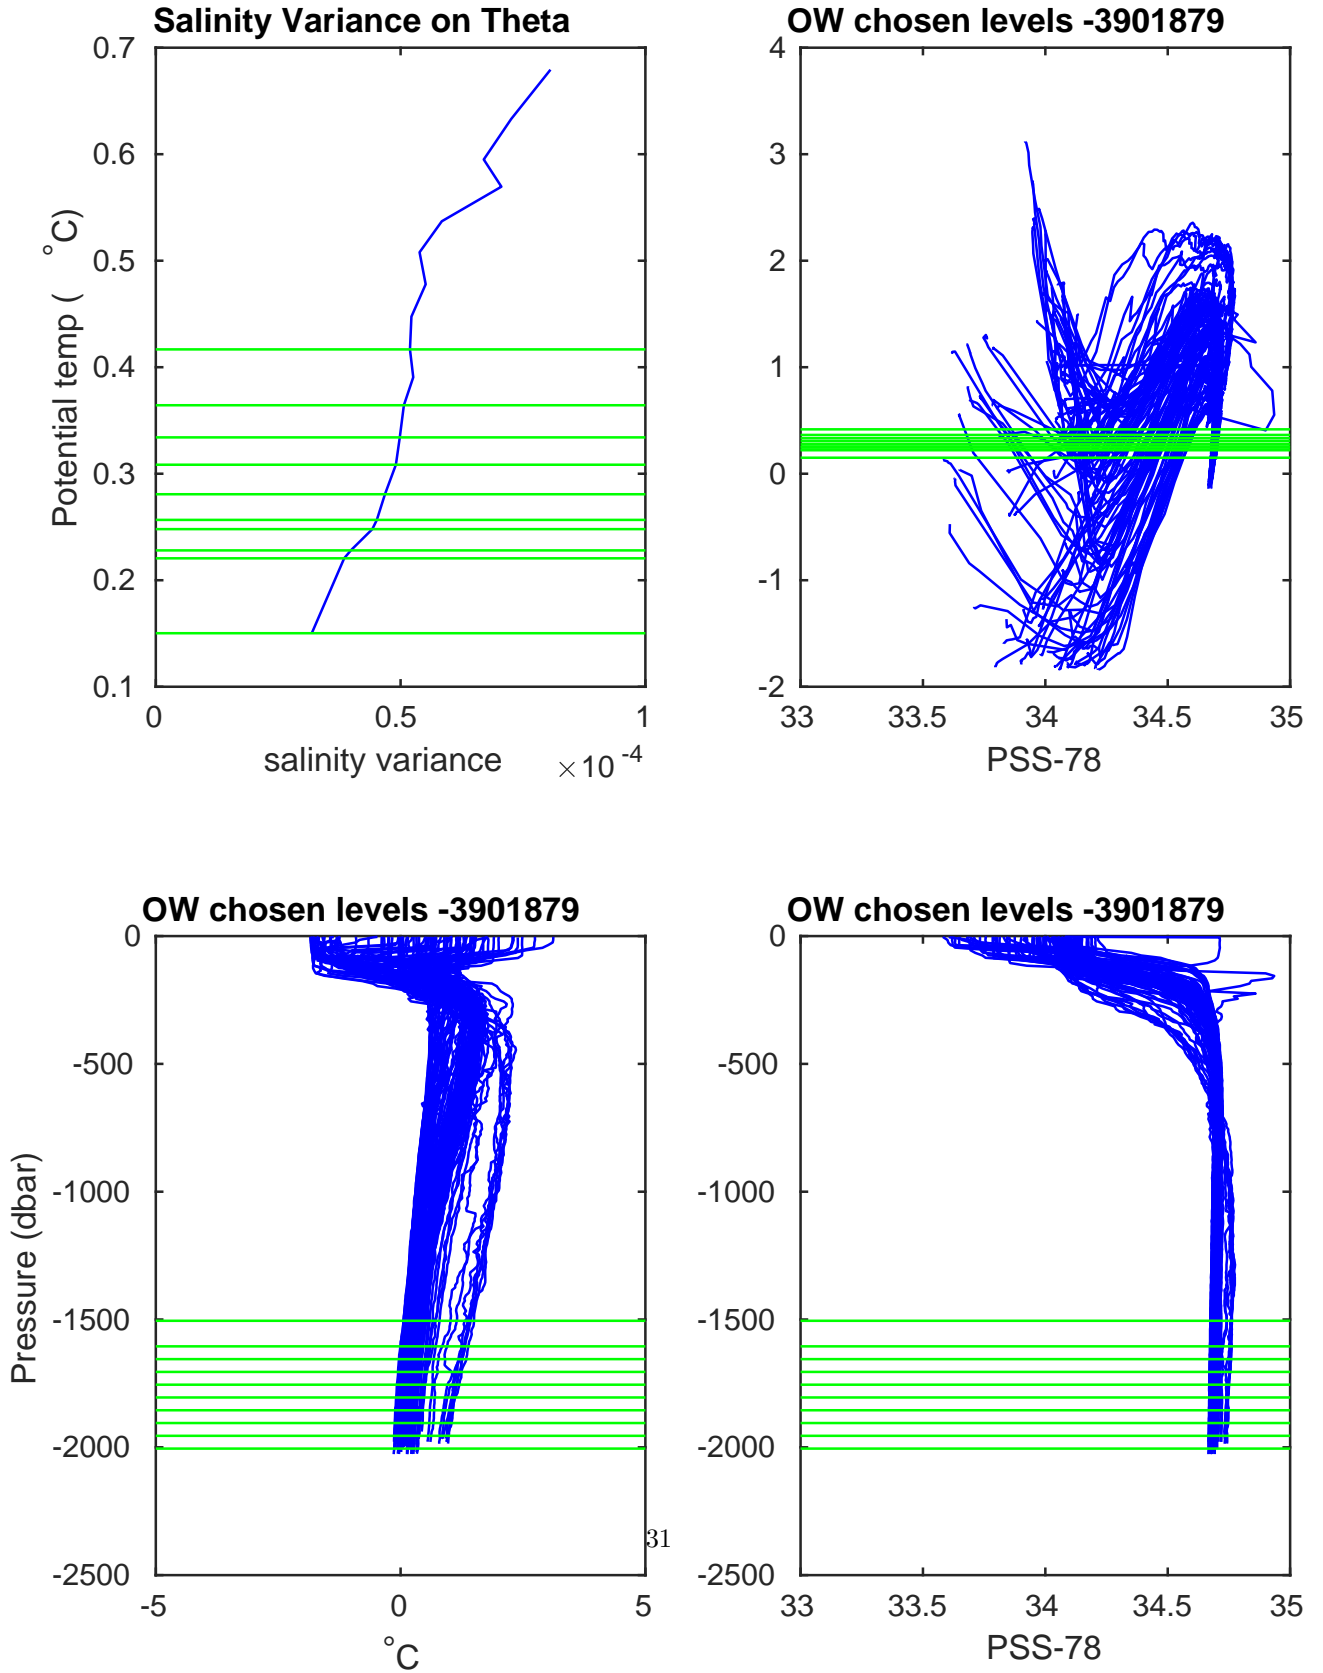

Figure 22: Float 3901879. Salinity, salinity variance on theta and OW chosen levels.

### 3.3 Summary and Conclusions

The theta levels were set between 1000 m. Float looks like is drifting from the beginning of its life. There is also a very small error associated to the data. Altimeter data also revealed some strong disagreement with float data. The OWC corrections has been applied to the entire float 1-102; QC=2; error 0.005.

## 4 Final Checks
