

Delayed mode quality control of MOCCA Argo float 3901887

Kamila Walicka

British National Data Centre (BODC), National Oceanography Centre
Joseph Proudman Building, 6, Brownlow St, Liverpool L3 5DA

January 23, 2020

Summary

The assessed error of salinity for cycles 1-120 is 0.005; 121-199 is 0.015 and 200- 286 is 0.01. No further corrections is required.

WMO number	DM correction
3901887	No correction

1 Introduction

Delayed mode analysis was performed for float number 360521i (3901887) where salinity and temperature values were separately compared to nearby historical CTD profiles and nearby Argo profiles as a reference database. The OWC (Cabanes et al., 2016) method was run to estimate a salinity offset and/or a salinity drift. For more information about float 360521i (3901887) click on the following link: <http://www.ifremer.fr/argoMonitoring/float/3901887>

2 Quality Check of Argo Float Data

2.1 Time Series of Vertical Distribution of Data

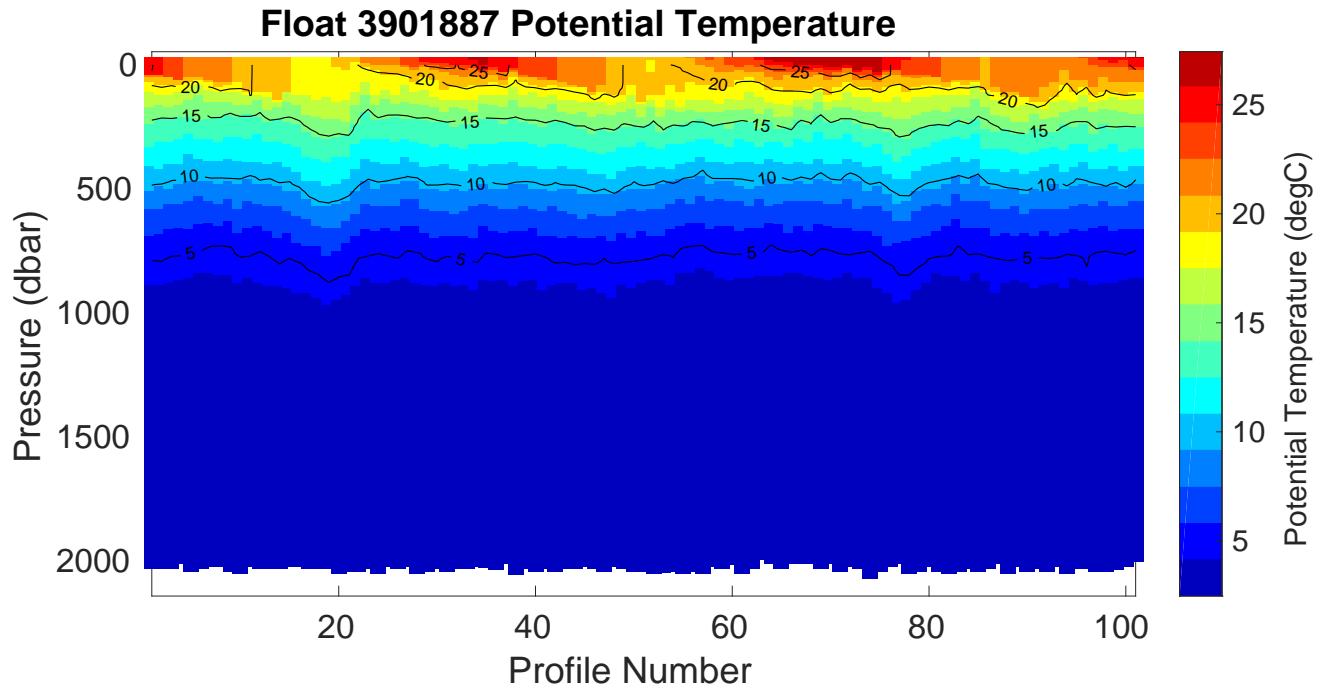

Figure 1: Float 3901887. Time series of the vertical distribution of potential temperature (°C).

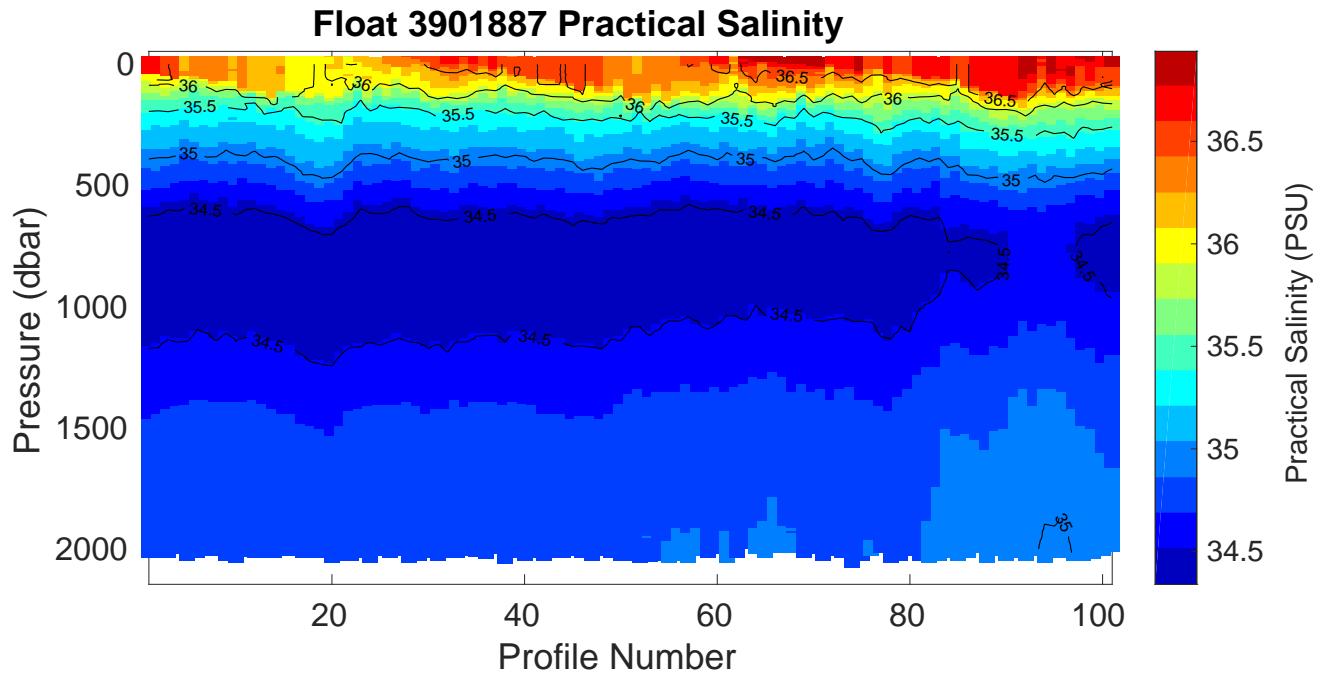

Figure 2: Float 3901887. Time series of the vertical distribution of practical salinity (PSU).

2.2 Comparison between Argo Float and Climatology

The comparison between float 3901887 and data from WMO boxes $\pm 10^\circ$ of latitude and longitude shows that the Argo profiles fit within the expected ranges (Figures 3, 4 and 5). This result confirms that float 3901887 represents relatively stable and consistent with the expected physical conditions in this region.

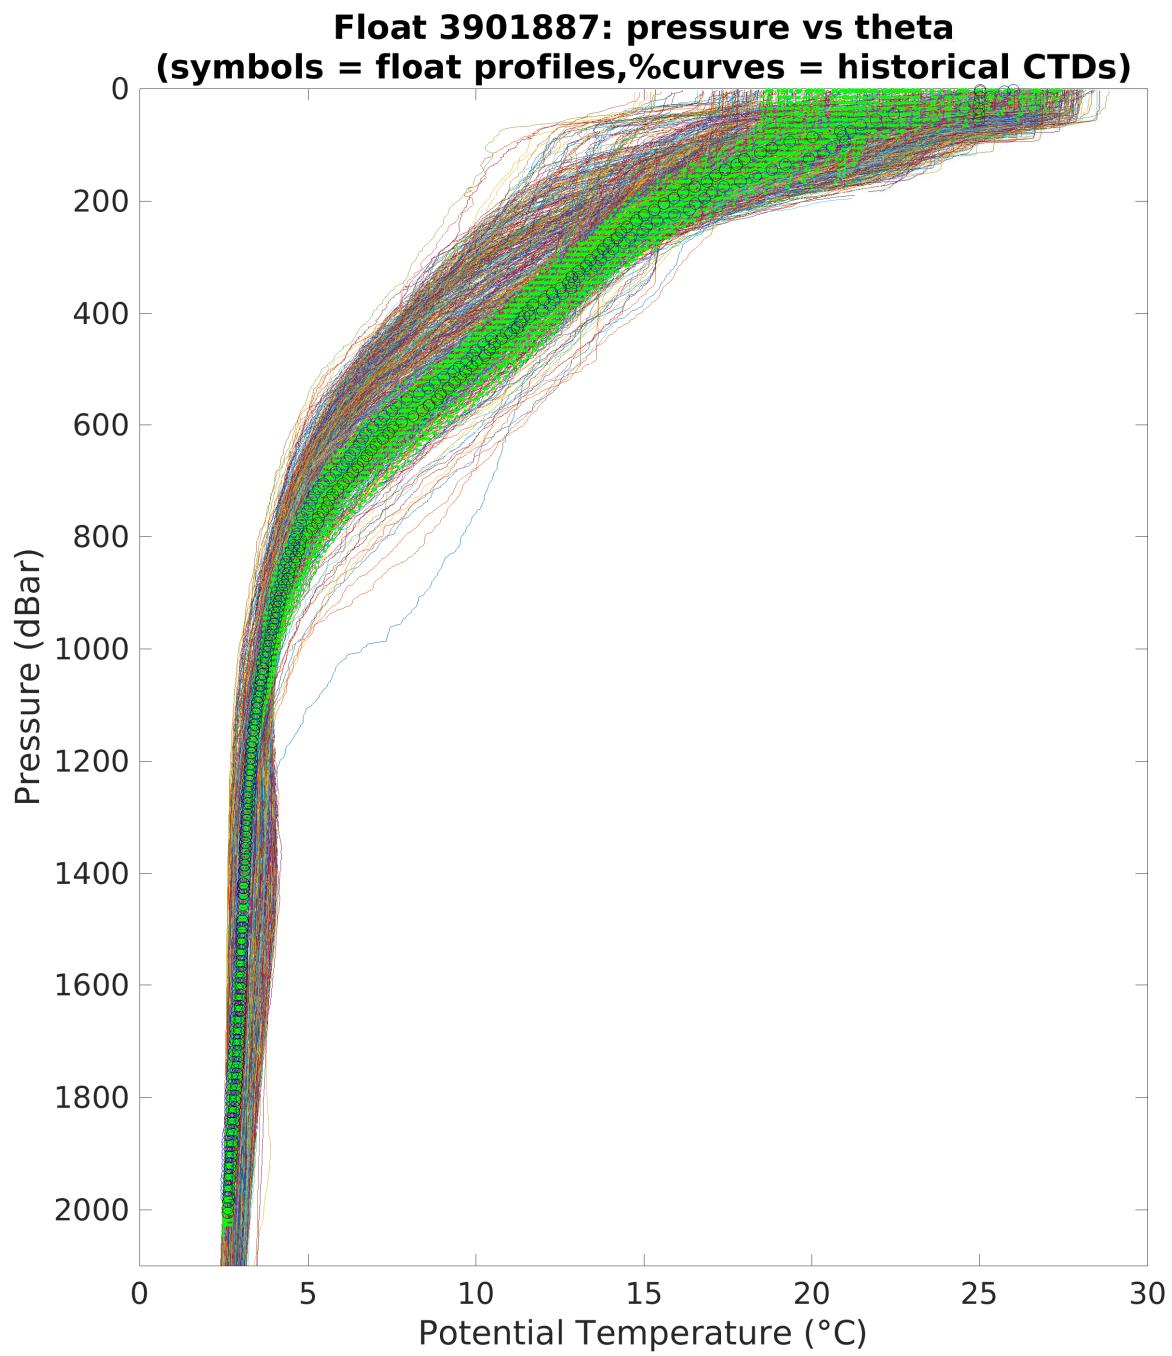

Figure 3: Float 3901887. Float profile of potential temperature ($^{\circ}\text{C}$) plotted with climatology from the spatial range of 10 $^{\circ}$. The black and blue cycles indicates the first and the last Argo profile, respectively. Green symbols represent other Argo profiles.

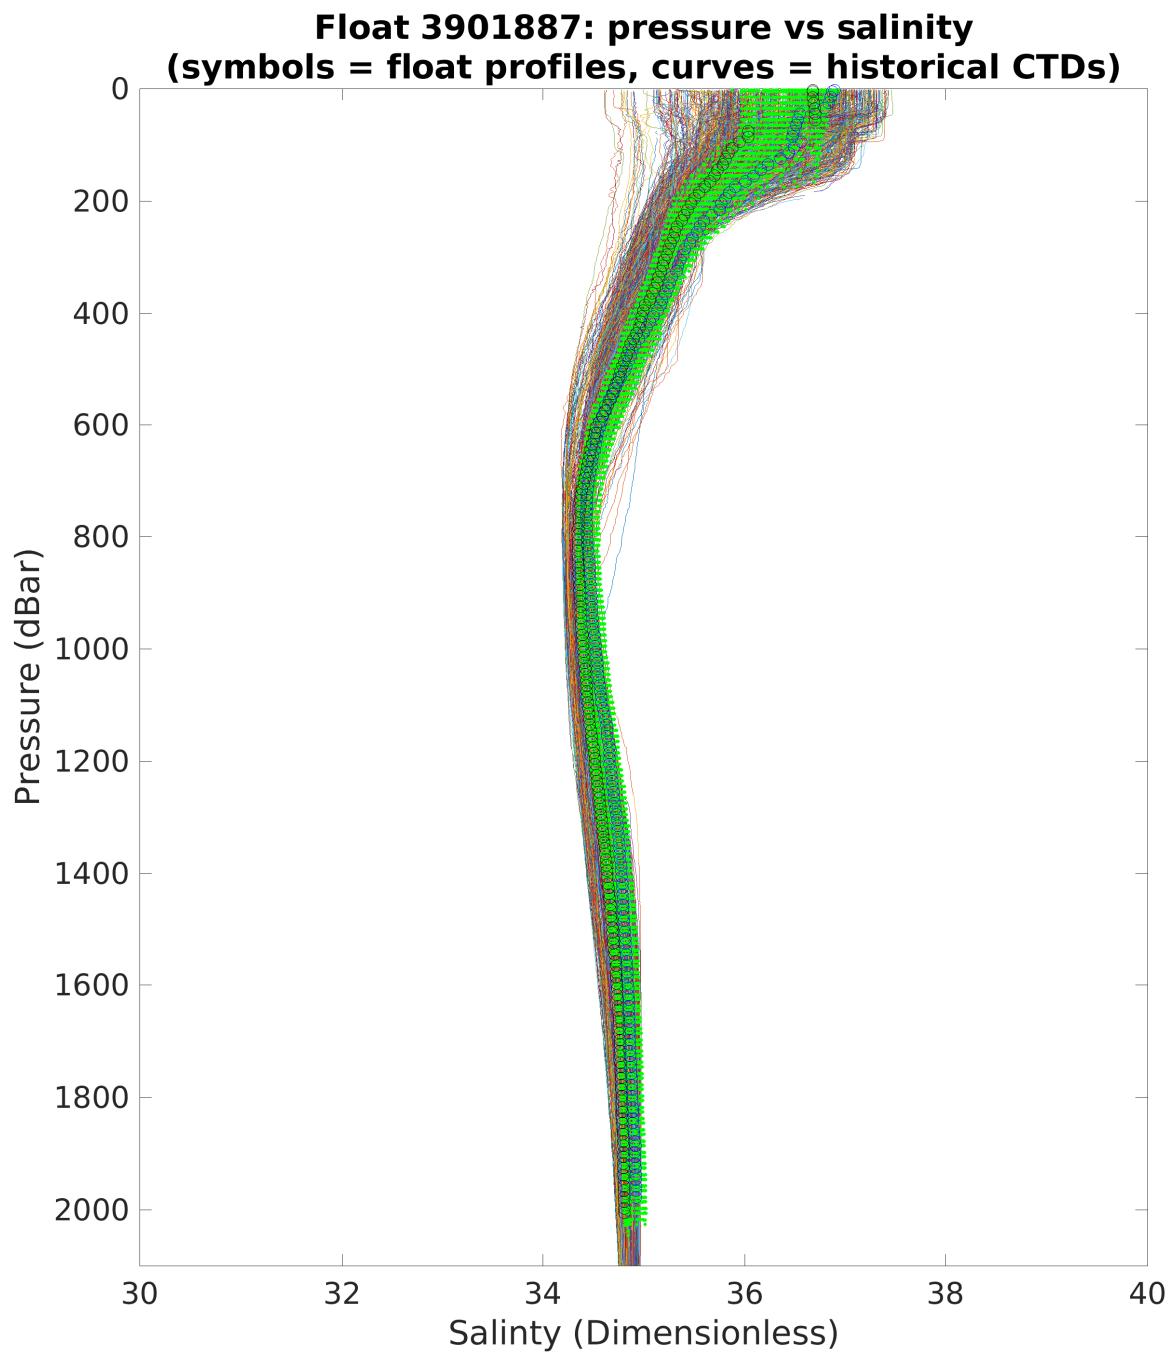

Figure 4: Float 3901887. Float profile of salinity (dimensionless) plotted with climatology from the spatial range of 10° . The black and blue cycles indicates the first and the last Argo profile, respectively. Green symbols represent other Argo profiles.

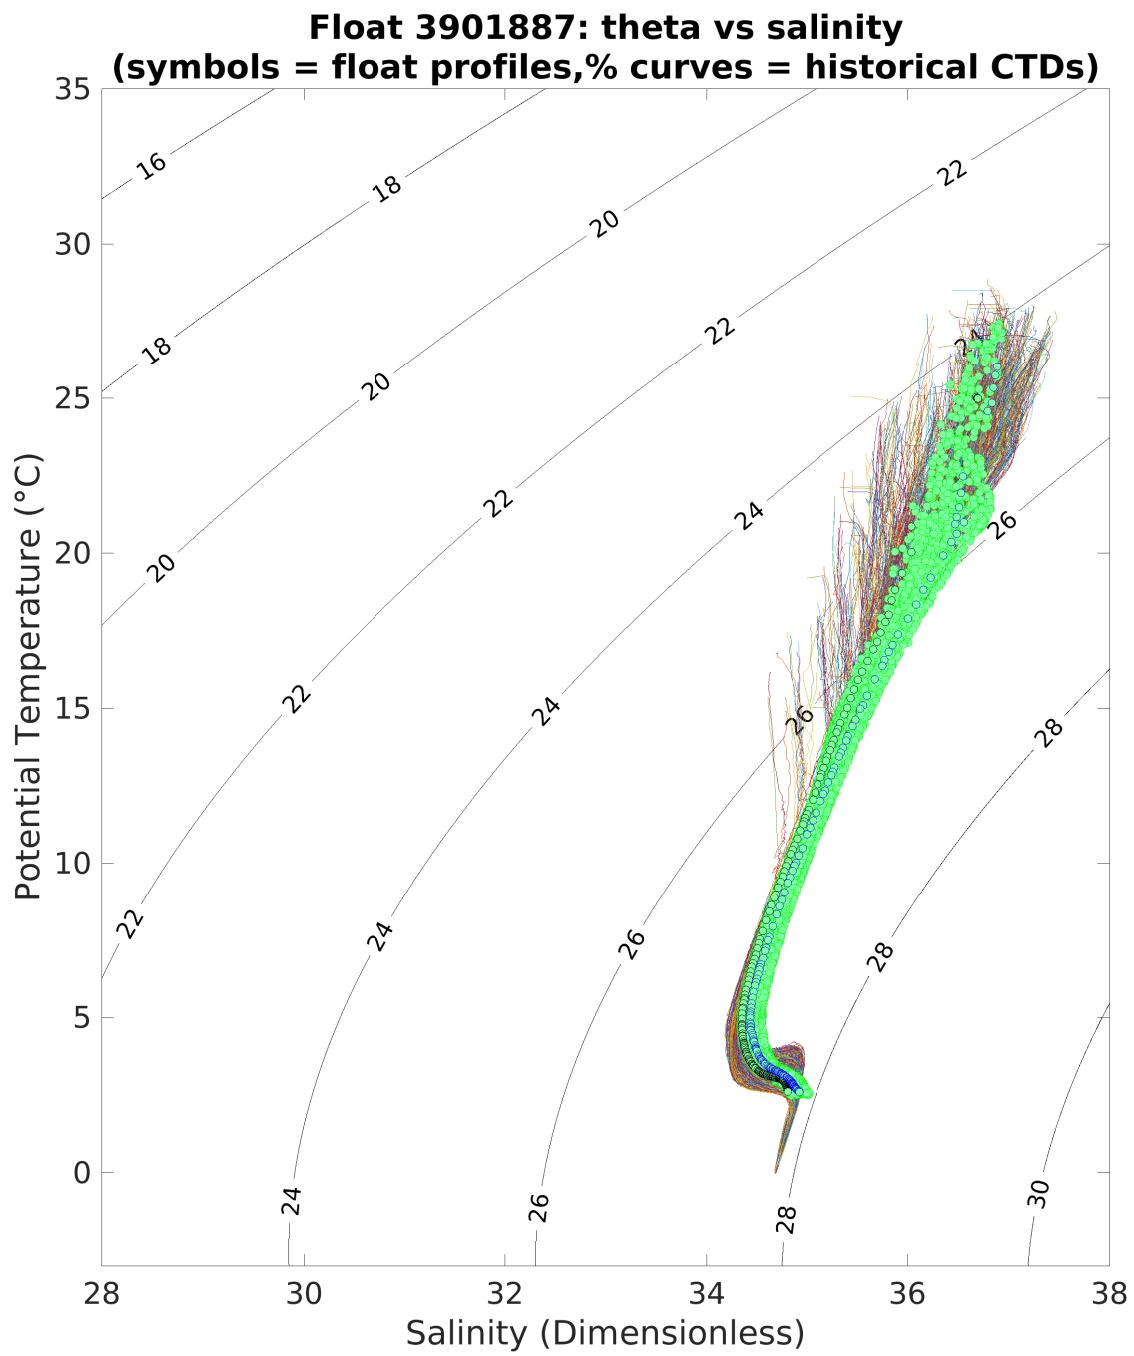

Figure 5: Float 3901887. Theta/S plotted with climatology from the spatial range of 10° . The black and blue cycles indicates the first and the last Argo profile, respectively. Green symbols represent other Argo profiles.

3.3 Summary and Conclusions

The Apex float was adjusted using the sea surface pressure data. The pressure sensor is not truncated, QC=1, error=2.4 dbar. The theta levels were set below 1000 m. The time series separated onto three time steps due to very long time series (almost 8 years) and different water masses. The assessed error of salinity for cycles 1-120 is 0.005; 121-199 is 0.015 and 200-286 is 0.01. No further corrections is required.
