

Delayed mode quality control of MOCCA Argo float 3901888

Kamila Walicka

British National Data Centre (BODC), National Oceanography Centre
Joseph Proudman Building, 6, Brownlow St, Liverpool L3 5DA

January 23, 2020

Summary

The assessed error of salinity for cycles 1-94 is 0.005. After cycle 94 float start to drifting. The OWC corrections was applies for the cycles 95-106 is 0.016, with the QC flags of 3.

WMO number	DM correction
3901888	Drift detected

1 Introduction

Delayed mode analysis was performed for float number 360720i (3901888) where salinity and temperature values were separately compared to nearby historical CTD profiles and nearby Argo profiles as a reference database. The OWC (Cabanes et al., 2016) method was run to estimate a salinity offset and/or a salinity drift. For more information about float 360720i (3901888) click on the following link: <http://www.ifremer.fr/argoMonitoring/float/3901888>

2 Quality Check of Argo Float Data

2.1 Time Series of Vertical Distribution of Data

Figure 1: Float 3901888. Time series of the vertical distribution of potential temperature ($^{\circ}\text{C}$).

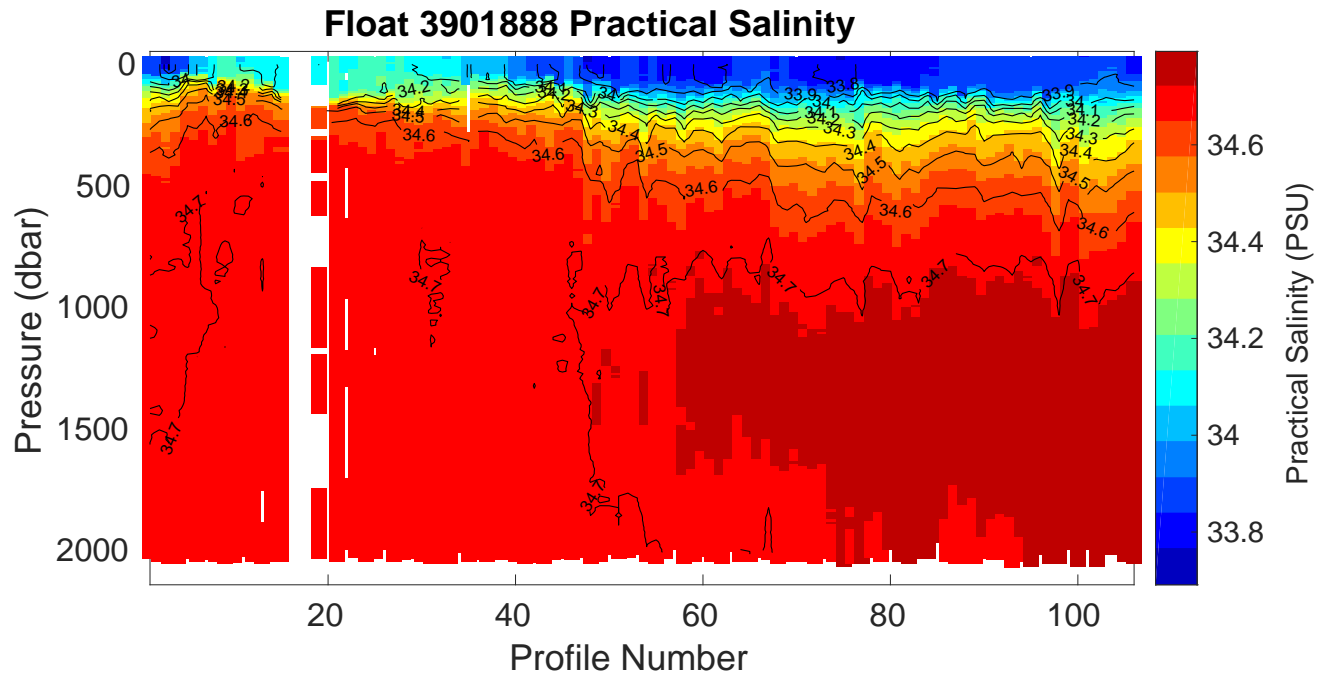

Figure 2: Float 3901888. Time series of the vertical distribution of practical salinity (PSU).

2.2 Comparison between Argo Float and Climatology

The comparison between float 3901888 and data from WMO boxes $\pm 10^\circ$ of latitude and longitude shows that the Argo profiles fit within the expected ranges (Figures 3, 4 and 5). This result confirms that float 3901888 represents relatively stable and consistent with the expected physical conditions in this region.

Figure 3: Float 3901888. Float profile of potential temperature (°C) plotted with climatology from the spatial range of 10°. The black and blue cycles indicates the first and the last Argo profile, respectively. Green symbols represent other Argo profiles.

Figure 4: Float 3901888. Float profile of salinity (dimensionless) plotted with climatology from the spatial range of 10° . The black and blue cycles indicates the first and the last Argo profile, respectively. Green symbols represent other Argo profiles.

Figure 5: Float 3901888. Theta/S plotted with climatology from the spatial range of 10°. The black and blue cycles indicates the first and the last Argo profile, respectively. Green symbols represent other Argo profiles.

2.3 Satellite Altimeter comparison

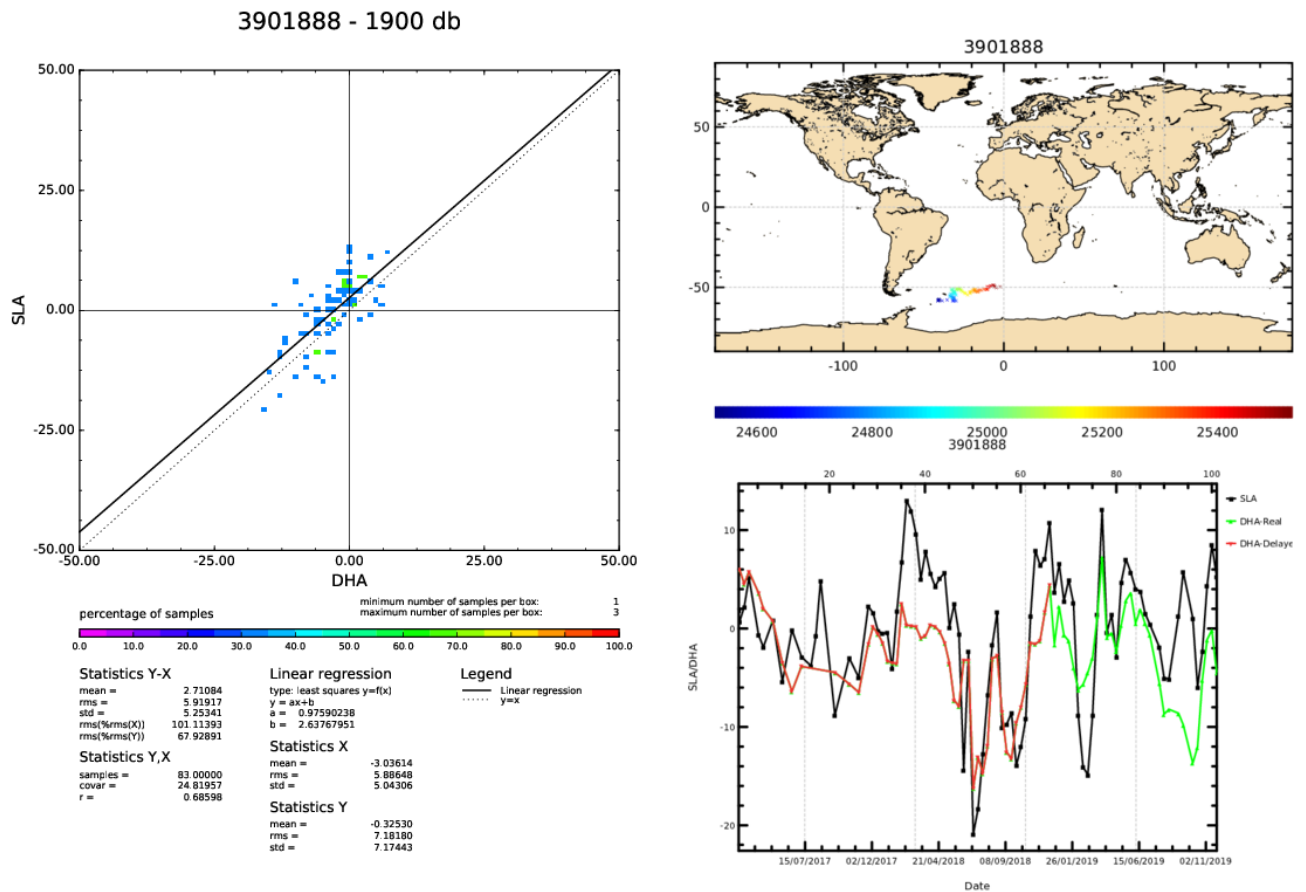

Figure 6: Float 3901888. The comparison between the Sea Surface Height (SSH) from the satellite altimetry and Dynamic Height Anomaly (DHA) extracted from the Argo float temperature and salinity data

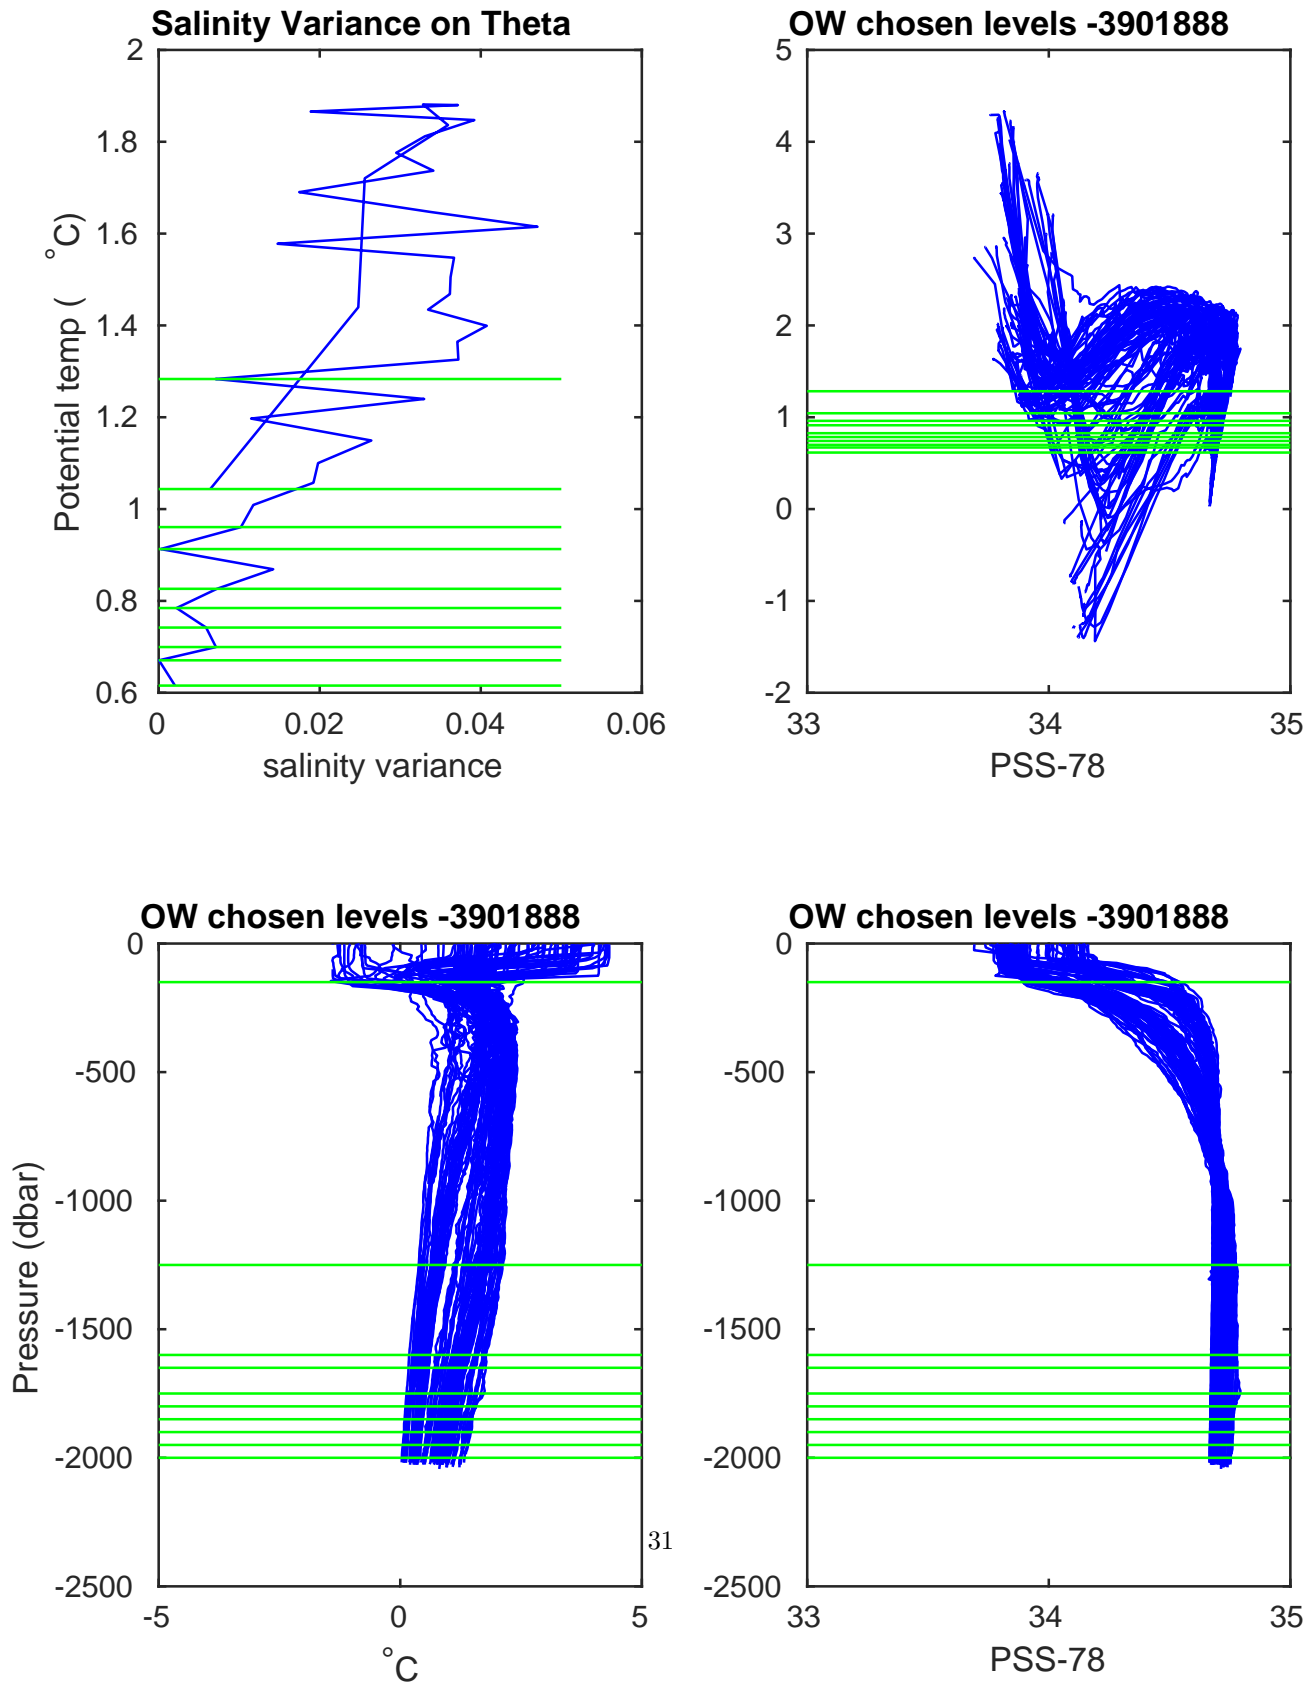

Figure 22: Float 3901888. Salinity, salinity variance on theta and OW chosen levels.

3.3 Summary and Conclusions

The floats is probably drifting from cycle 95. For the already existing data float is still correctable. The OWC corrections was applies for cycles between 95 and 106, with error 0.016 and QC flag of 3.
