

Delayed mode quality control of Argo float
6901174 as part of the BioGeoChemical Argo
(BGC-Argo) project

Summary

The comparison between Argo float 6901174, from cycle 1 to 260, showed relatively good consistency with the reference data, within the errorbars suggested by manufacturer (< 0.01). From cycle 261 to 341 float showed the drift that is the effect of the conductivity sensor drift toward higher salinity. These cycles were set with the QC of 4.

WMO number	DM correction
6901174	No correction

1 Introduction

Delayed mode analysis was performed for float number mb004 (6901174) where salinity and temperature values were separately compared to nearby historical CTD profiles and nearby Argo profiles as a reference database. The OWC (Cabanes et al., 2016) method was run to estimate a salinity offset and/or a salinity drift.

2 Quality Check of Argo Float Data

2.1 Time Series of Vertical Distribution of Data

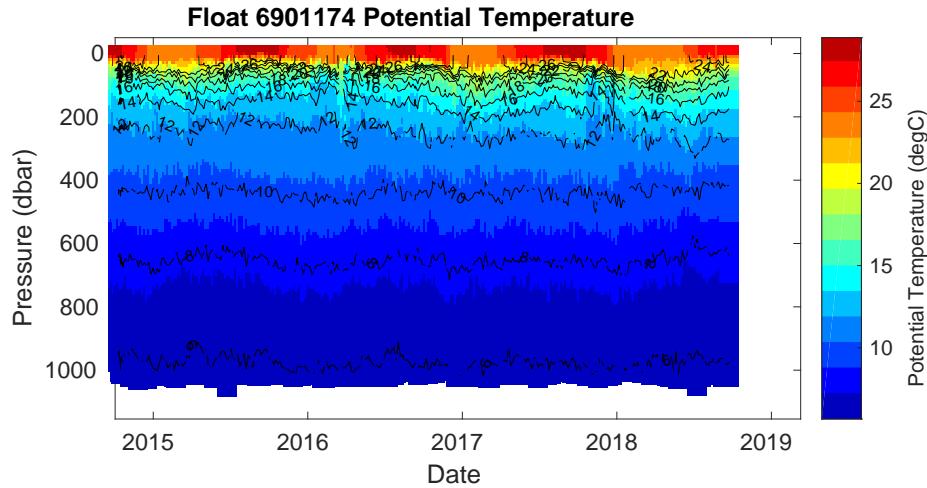

Figure 1: Float 6901174. Time series of the vertical distribution of potential temperature (°C).

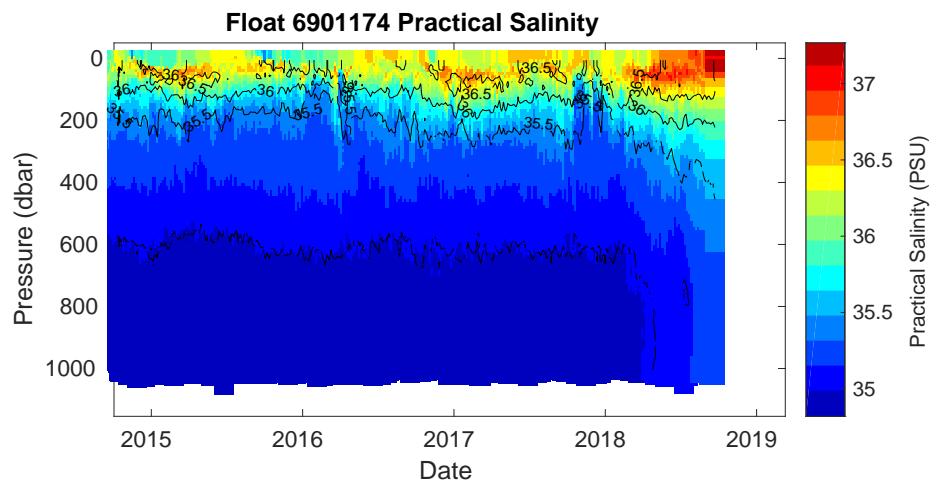

Figure 2: Float 6901174. Time series of the vertical distribution of practical salinity (PSU).

2.2 Comparison between Argo Float and Climatology

The comparison between float 6901174 and data from WMO boxes +/- 10° of latitude and longitude shows that the Argo profiles fit within the expected ranges (Figures 3, 4 and 5). This result confirms that float 6901174 represents relatively stable and consistent with the expected physical conditions in this region.

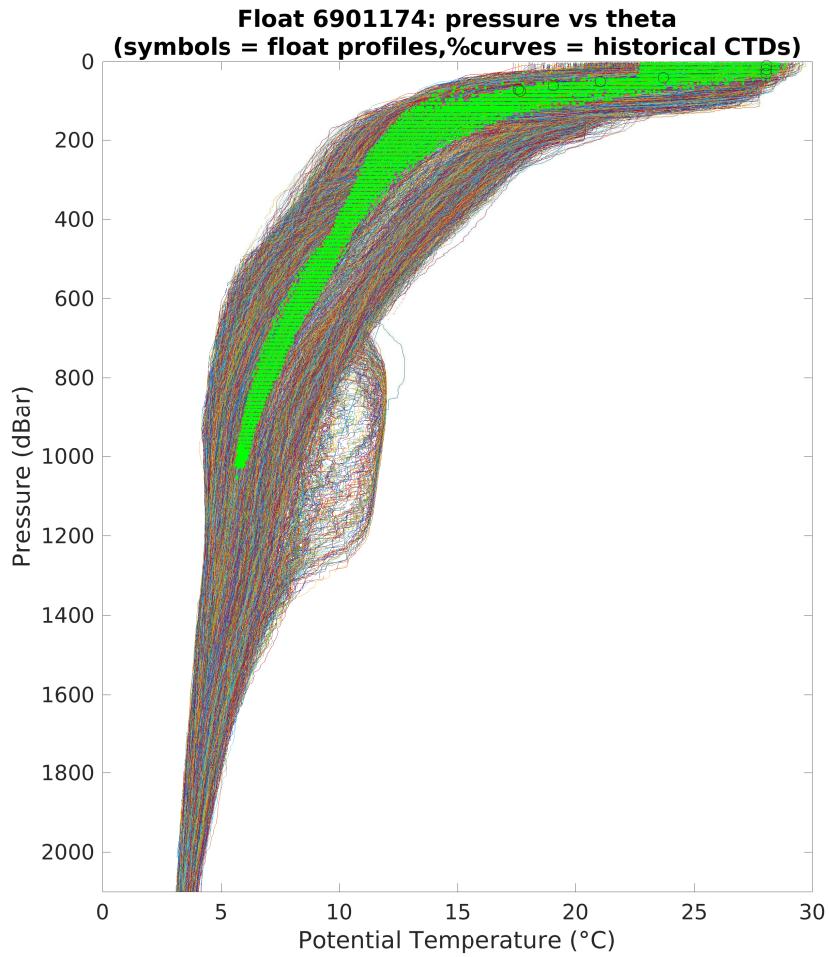

Figure 3: Float 6901174. Float profile of potential temperature ($^{\circ}\text{C}$) plotted with climatology from the spatial range of 10° . The black and blue cycles indicates the first and the last Argo profile, respectively. Green symbols represent other Argo profiles.

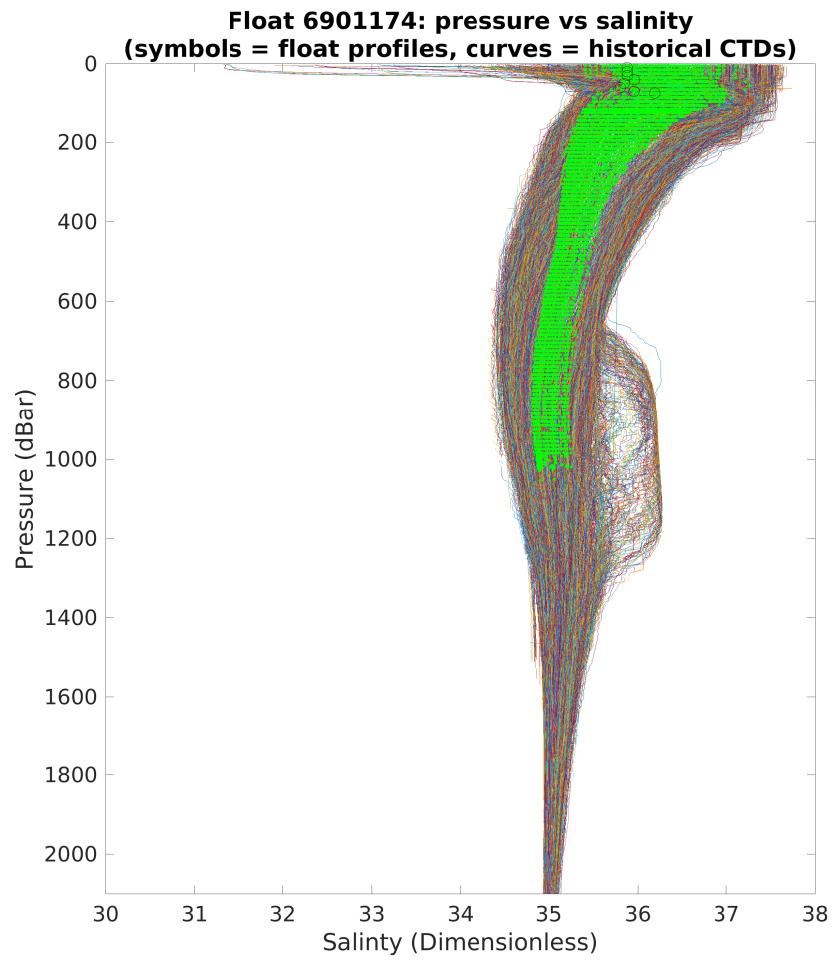

Figure 4: Float 6901174. Float profile of salinity (dimensionless) plotted with climatology from the spatial range of 10 °. The black and blue cycles indicates the first and the last Argo profile, respectively. Green symbols represent other Argo profiles.

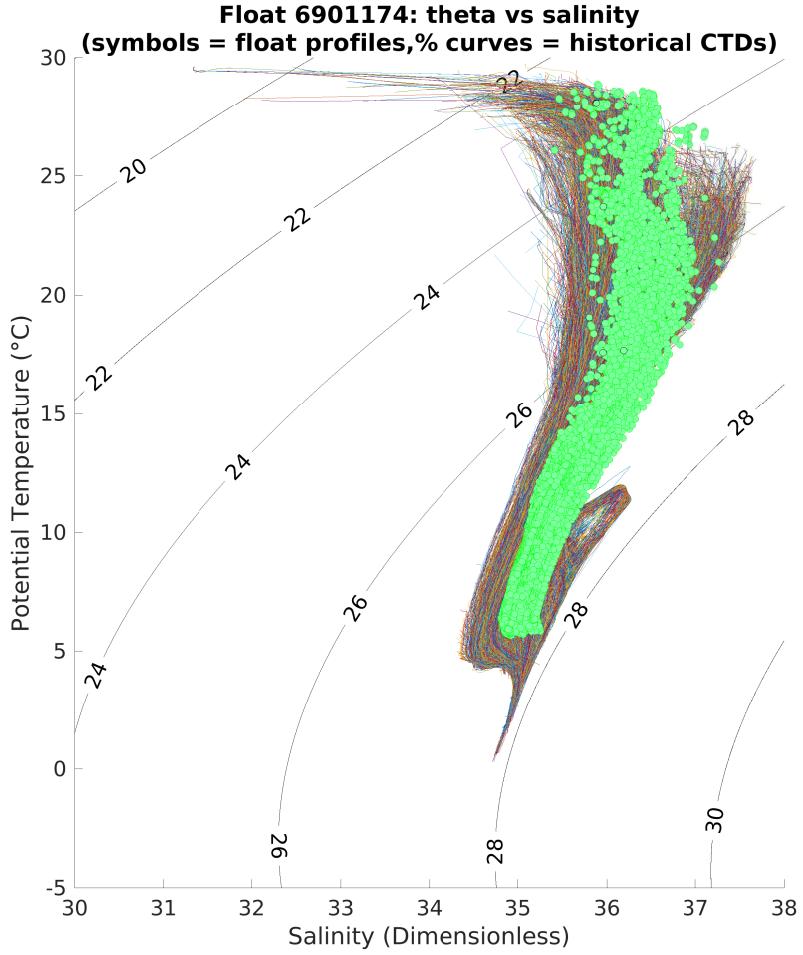

Figure 5: Float 6901174. Theta/S plotted with climatology from the spatial range of 10° . The black and blue cycles indicates the first and the last Argo profile, respectively. Green symbols represent other Argo profiles.

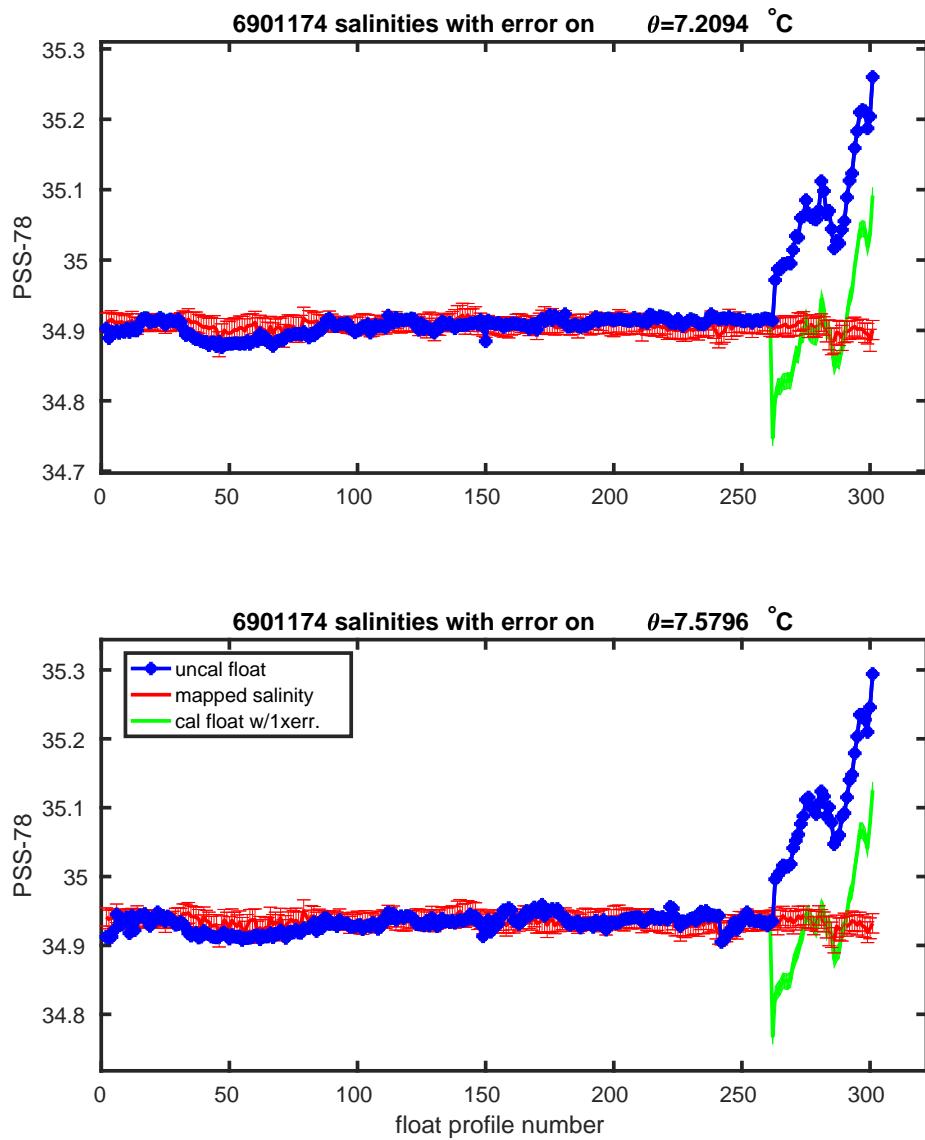

Figure 19: Float 6901174. Salinities with errors on θ .

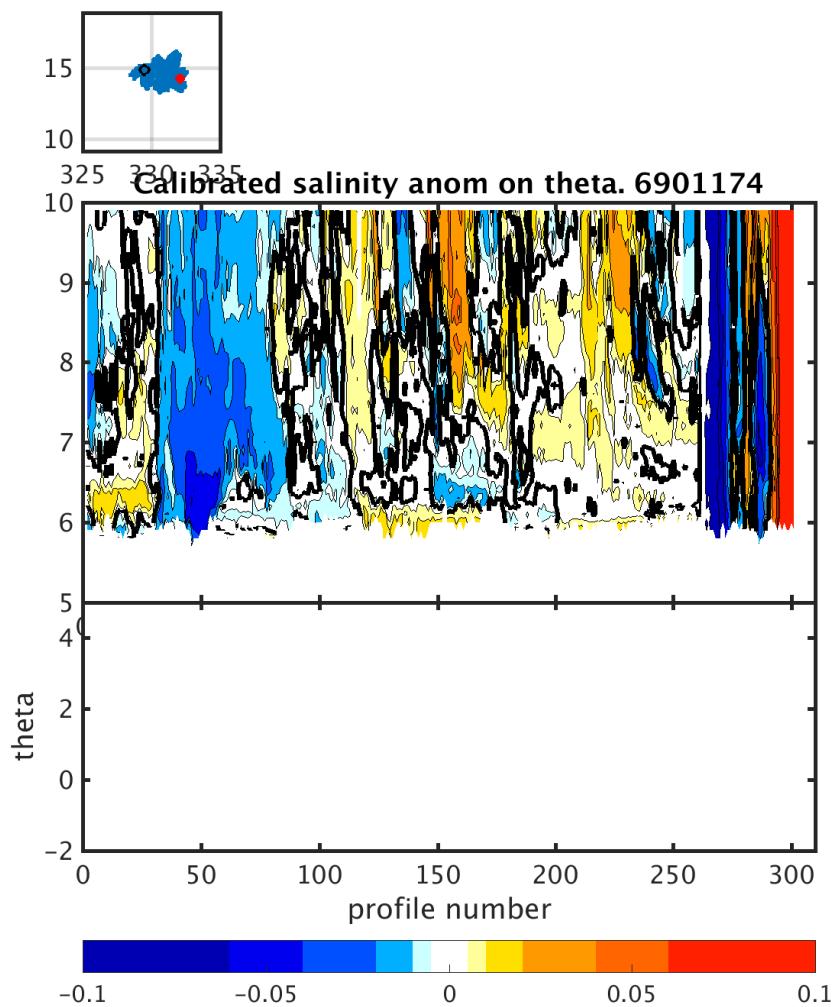

Figure 20: Float 6901174. Calibrated salinity anomaly on θ .

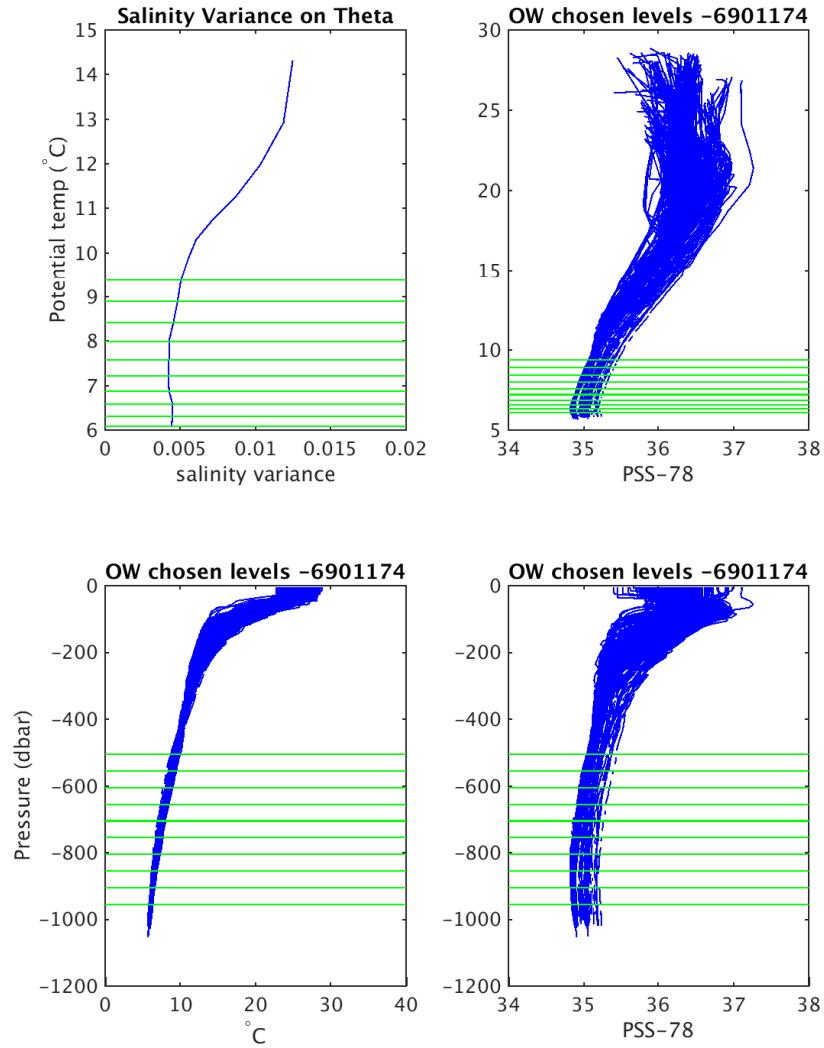

Figure 21: Float 6901174. Salinity, salinity variance on theta and OW chosen levels.

3.3 Summary and Conclusions

The configurations of the objective mapping parameters, set for float 6901174 , were applied separately for CTD and Argo reference data. The chosen theta levels lie above 1000 m due to a limited number of deep Argo float cycles.

In Section 3.2.2, from cycle 1 to 260, the salinity error obtained by comparing the Argo float to reference data of both CTD and Argo data was relatively low, below 0.01. From cycle 261 there was detected drift of conductivity sensor towards higher salinities. The drift was not adjustable using the OW method. The quality rank of *PRESARJUSTEDQC* and *PRESARJUSTEDQC* and *PRESARJUSTEDQC* between cycles 261 and 341 were set as 4.
