Float decision

The pressure sensor propagate well with QC=1, err= 2.4 dbar. Cell Thermal Mass corrections applied. Profile 1-308, small salty drift detected, OWC applied, QC=1, error=0.01.

1 Introduction

Delayed mode analysis was performed for float number 55669 (WMO: 6901121) where salinity and temperature values were separately compared to nearby historical CTD profiles and nearby Argo profiles as a reference database. The OWC (Cabanes et al., 2016) method was run to estimate a salinity offset and a salinity drift. For more information about float 6901121 click on the following link: <http://www.ifremer.fr/argoMonitoring/float/6901121>

2 Quality Check of Argo Float Data

2.1 Satellite Altimeter comparison

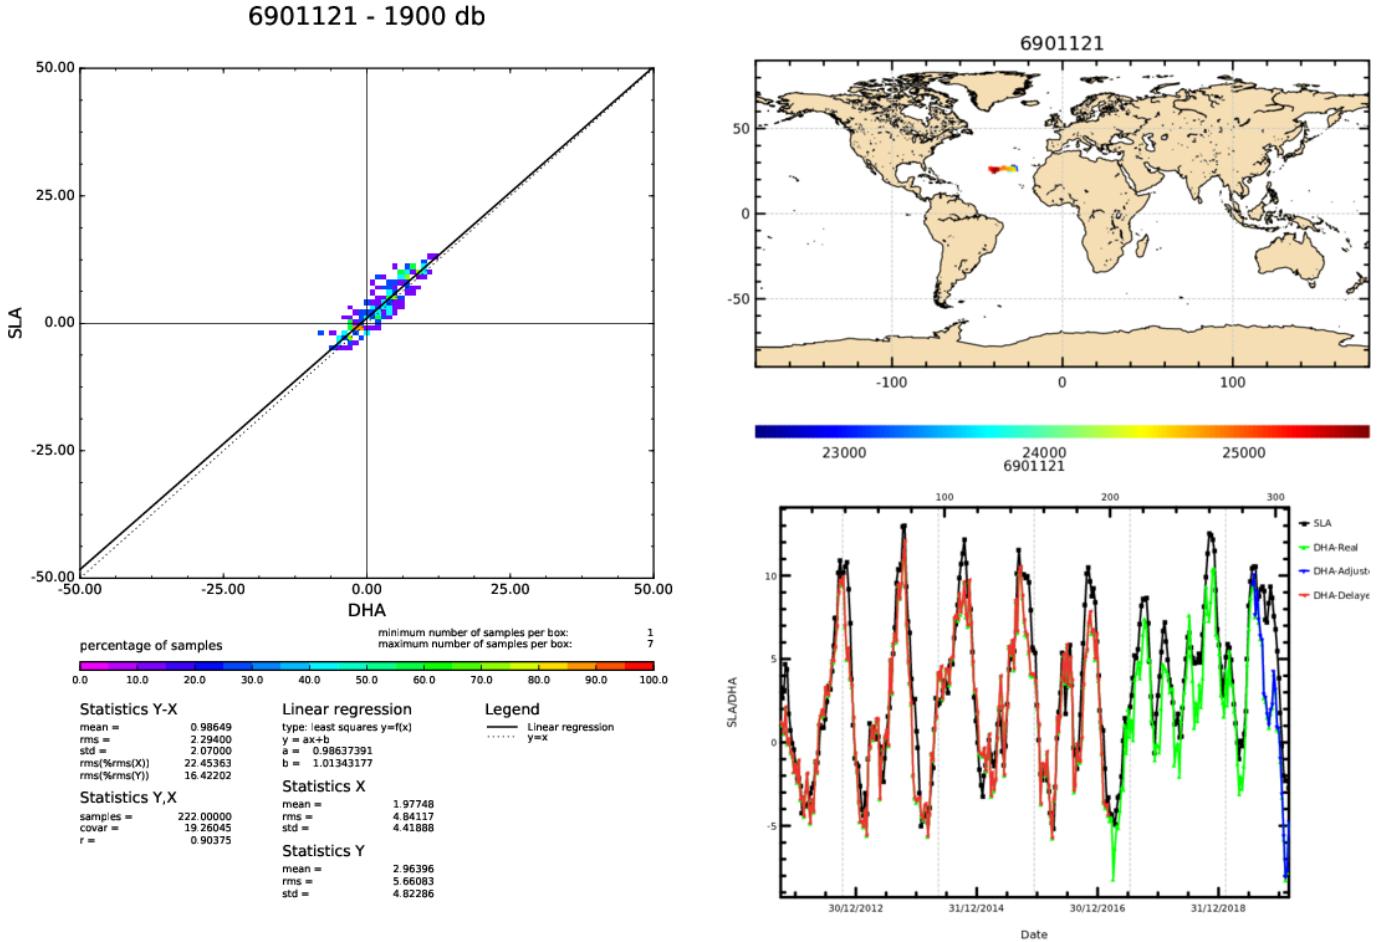

Figure 1: Float 6901121. The comparison between the Sea Surface Height (SSH) from the satellite altimetry and Dynamic Height Anomaly (DHA) extracted from the Argo float temperature and salinity data (<ftp://ftp.ifremer.fr/ifremer/argo/etc/argo-ast9-item13-AltimeterComparison/figures/>).

2.2 Time Series of Vertical Distribution of Data

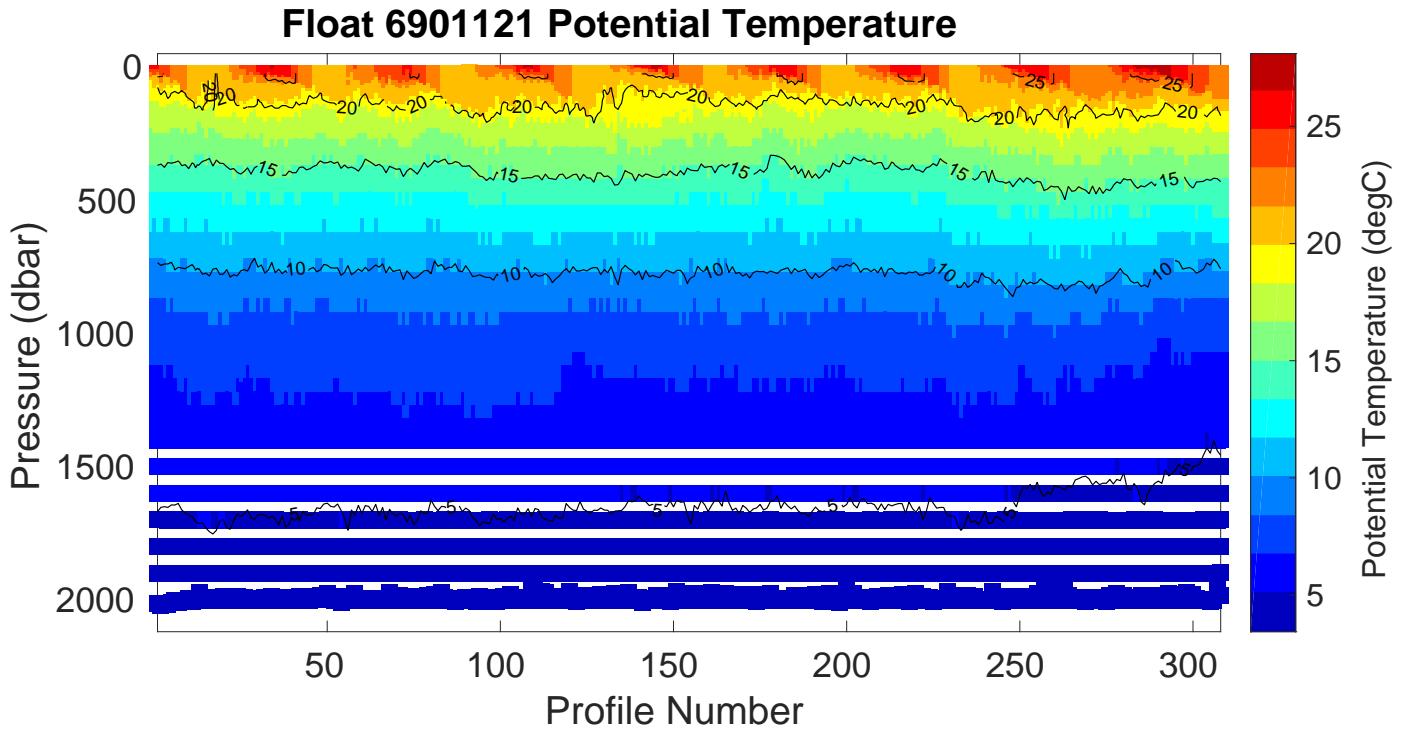

Figure 2: Float 6901121. Time series of the vertical distribution of potential temperature ($^{\circ}\text{C}$).

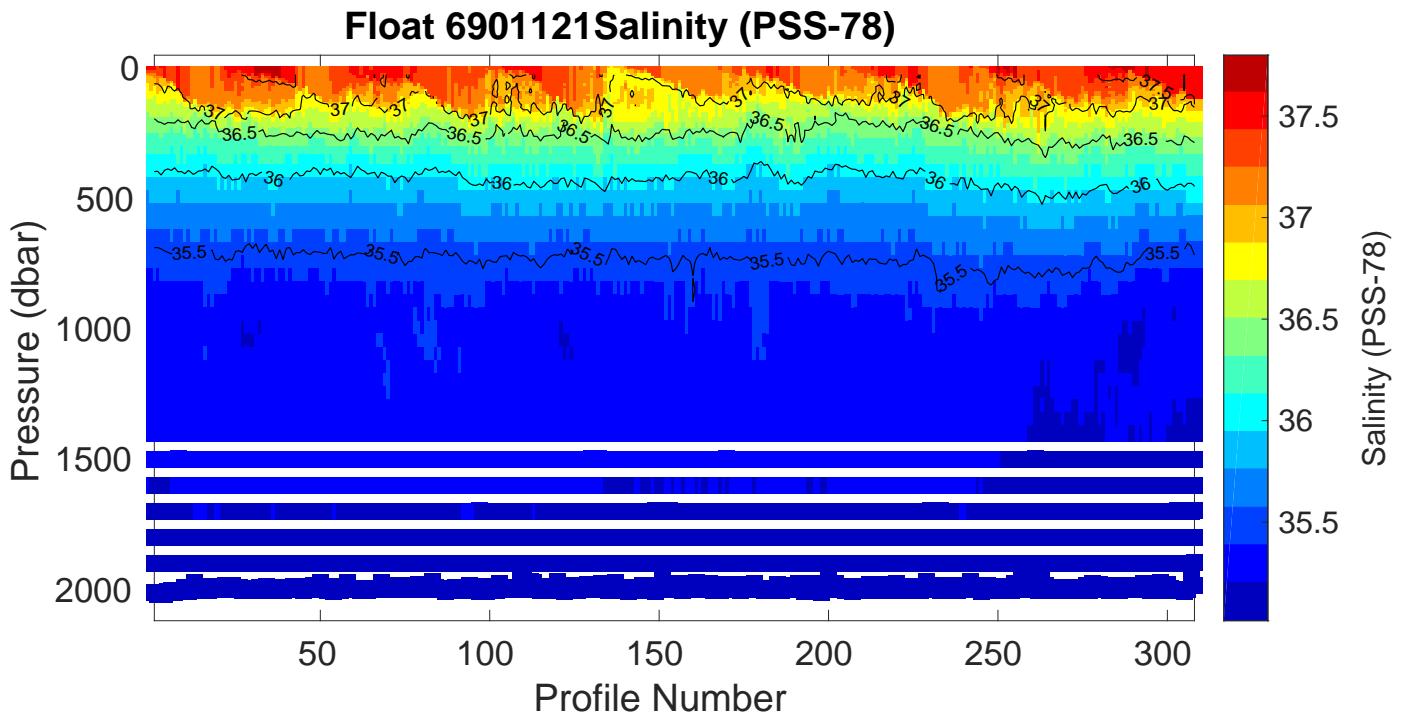

Figure 3: Float 6901121. Time series of the vertical distribution of salinity (PSS-78).

2.3 Comparison between Argo Float and Climatology

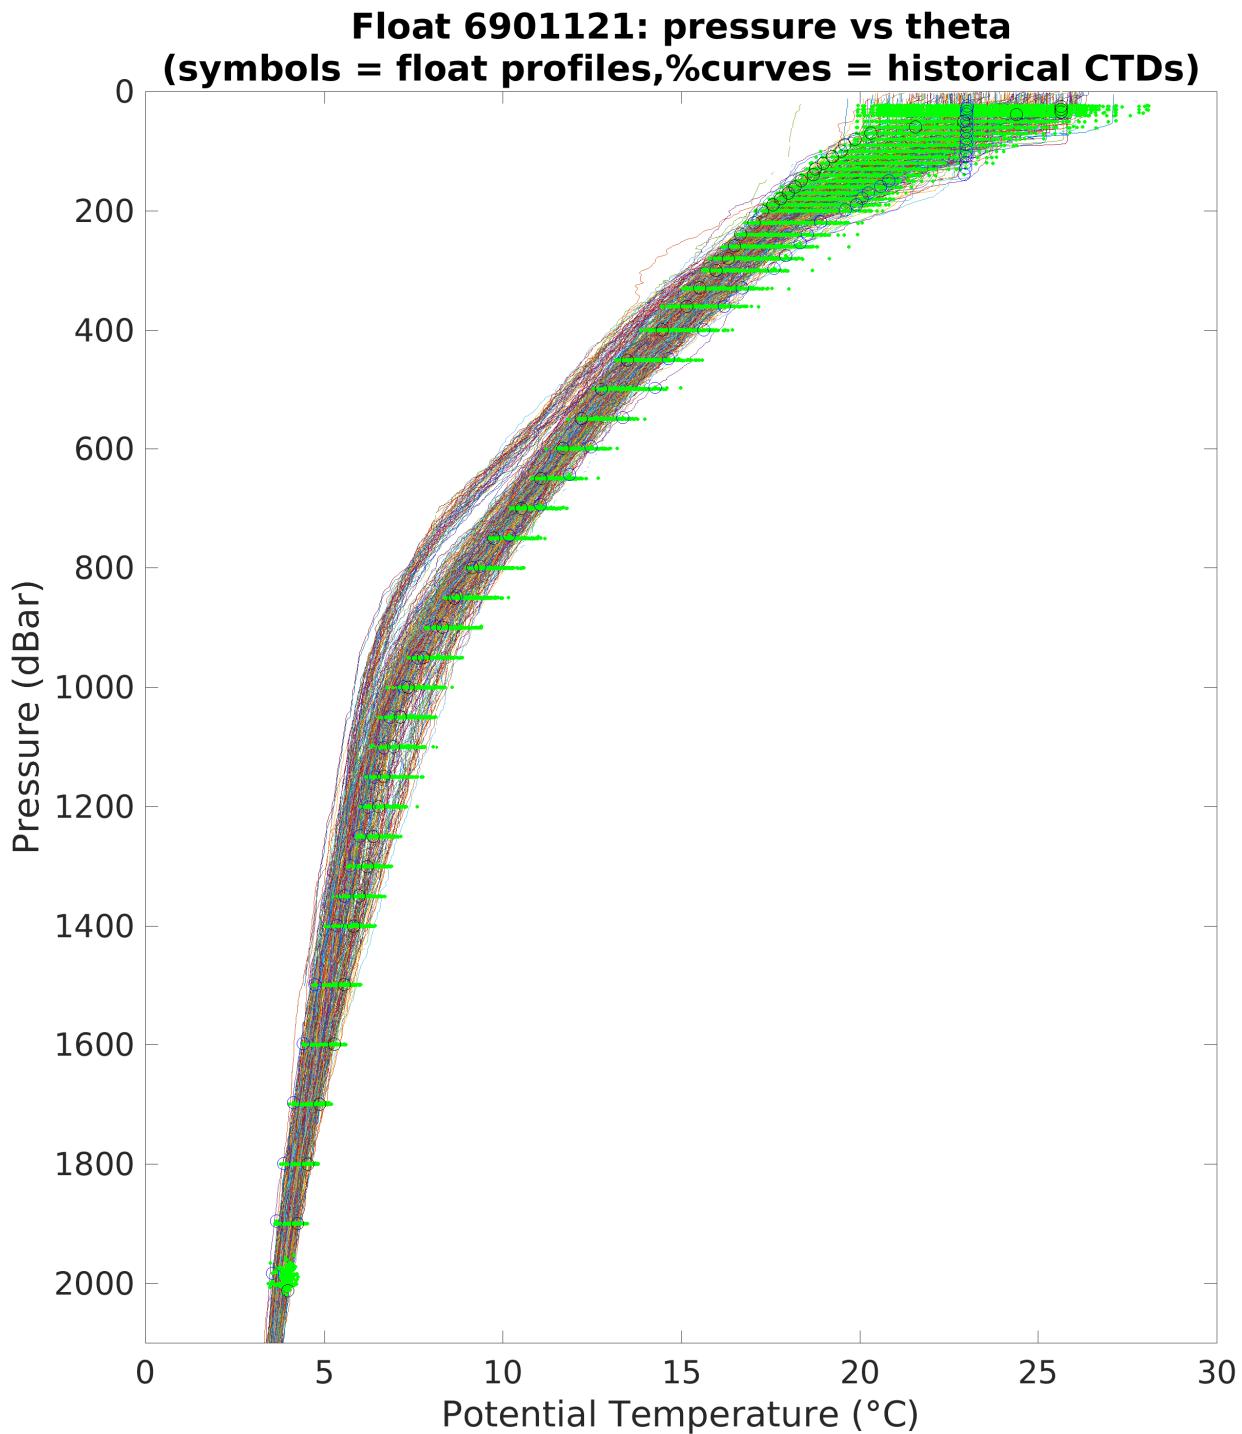

Figure 4: Float 6901121. Potential temperature ($^{\circ}\text{C}$) plotted with pressure (dBar) and data from WMO boxes of CTD reference data (CTD for DMQC 2019V01) \pm 10 $^{\circ}$ of latitude and longitude. The black and blue cycles indicate the first and the last Argo profile, respectively. Green symbols represent other Argo profiles from this float. The thin color lines indicate the reference data

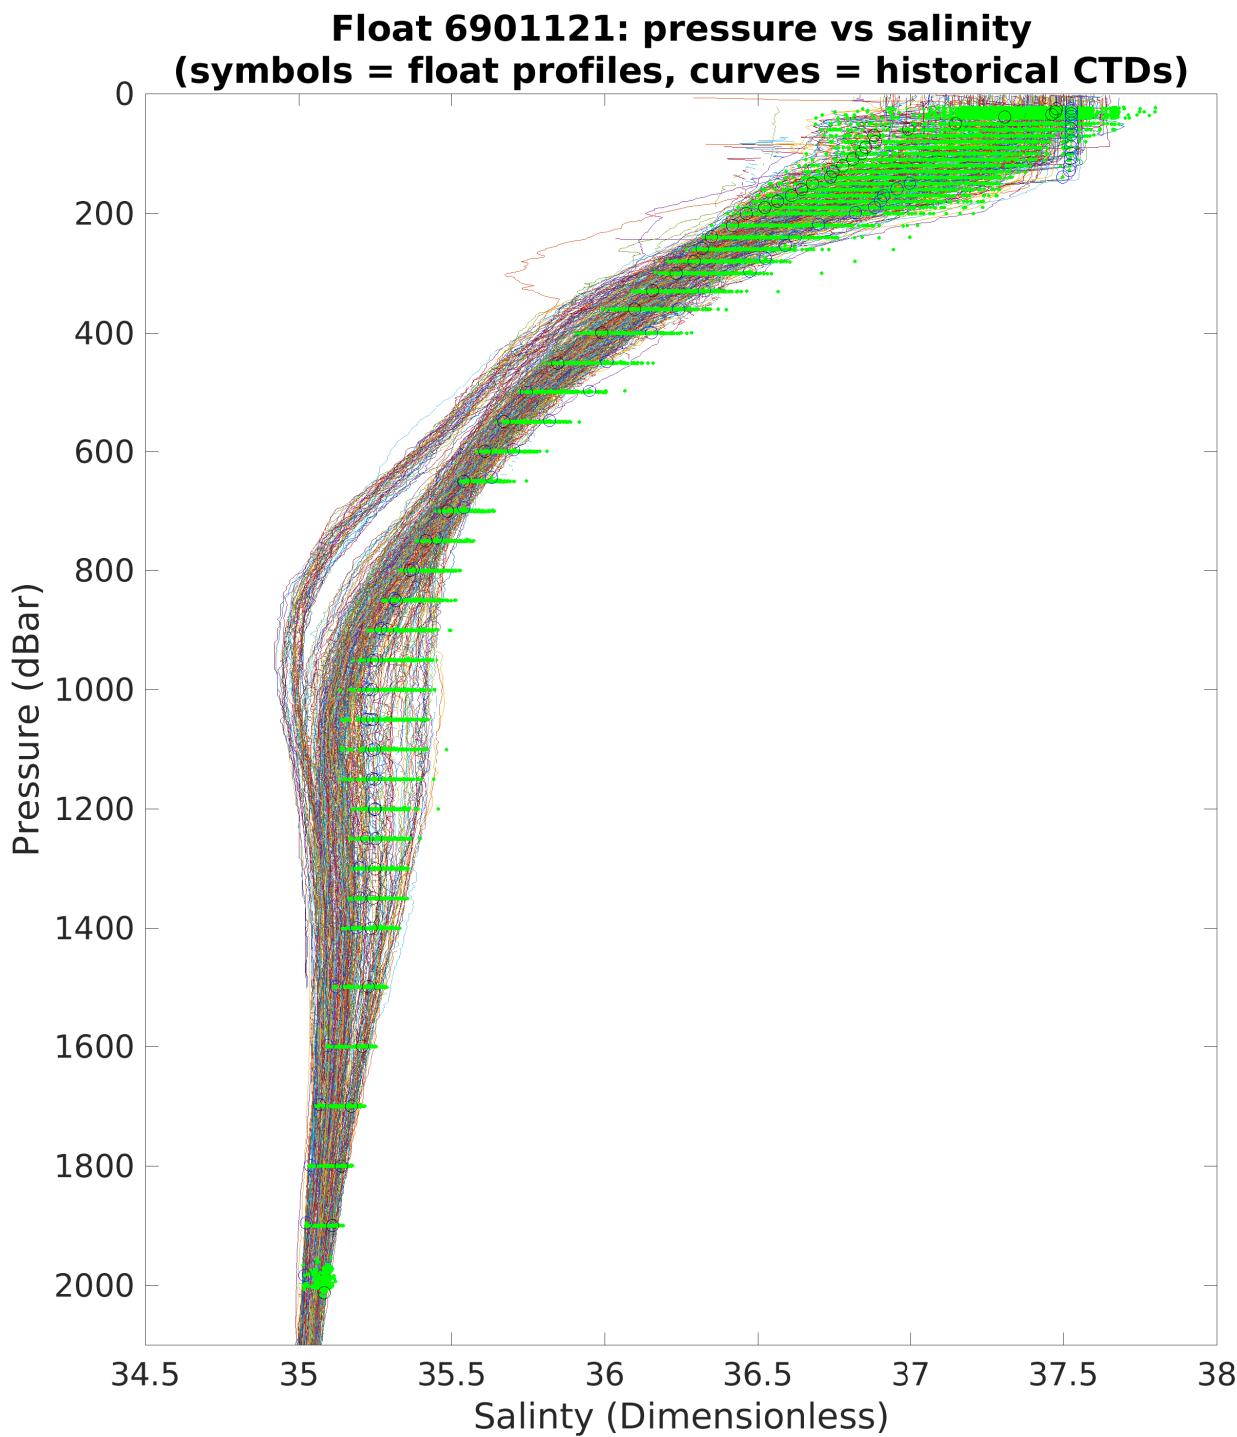

Figure 5: Float 6901121. Salinity (PSS-78) plotted with pressure (dBar) and data from WMO boxes of CTD reference data (CTD for DMQC 2019V01) +/- 10° of latitude and longitude. The black and blue cycles indicate the first and the last Argo profile, respectively. Green symbols represent other Argo profiles from this float. The thin colors lines indicate the reference data.

**Float 6901121: theta vs salinity
(symbols = float profiles,% curves = historical CTDs)**

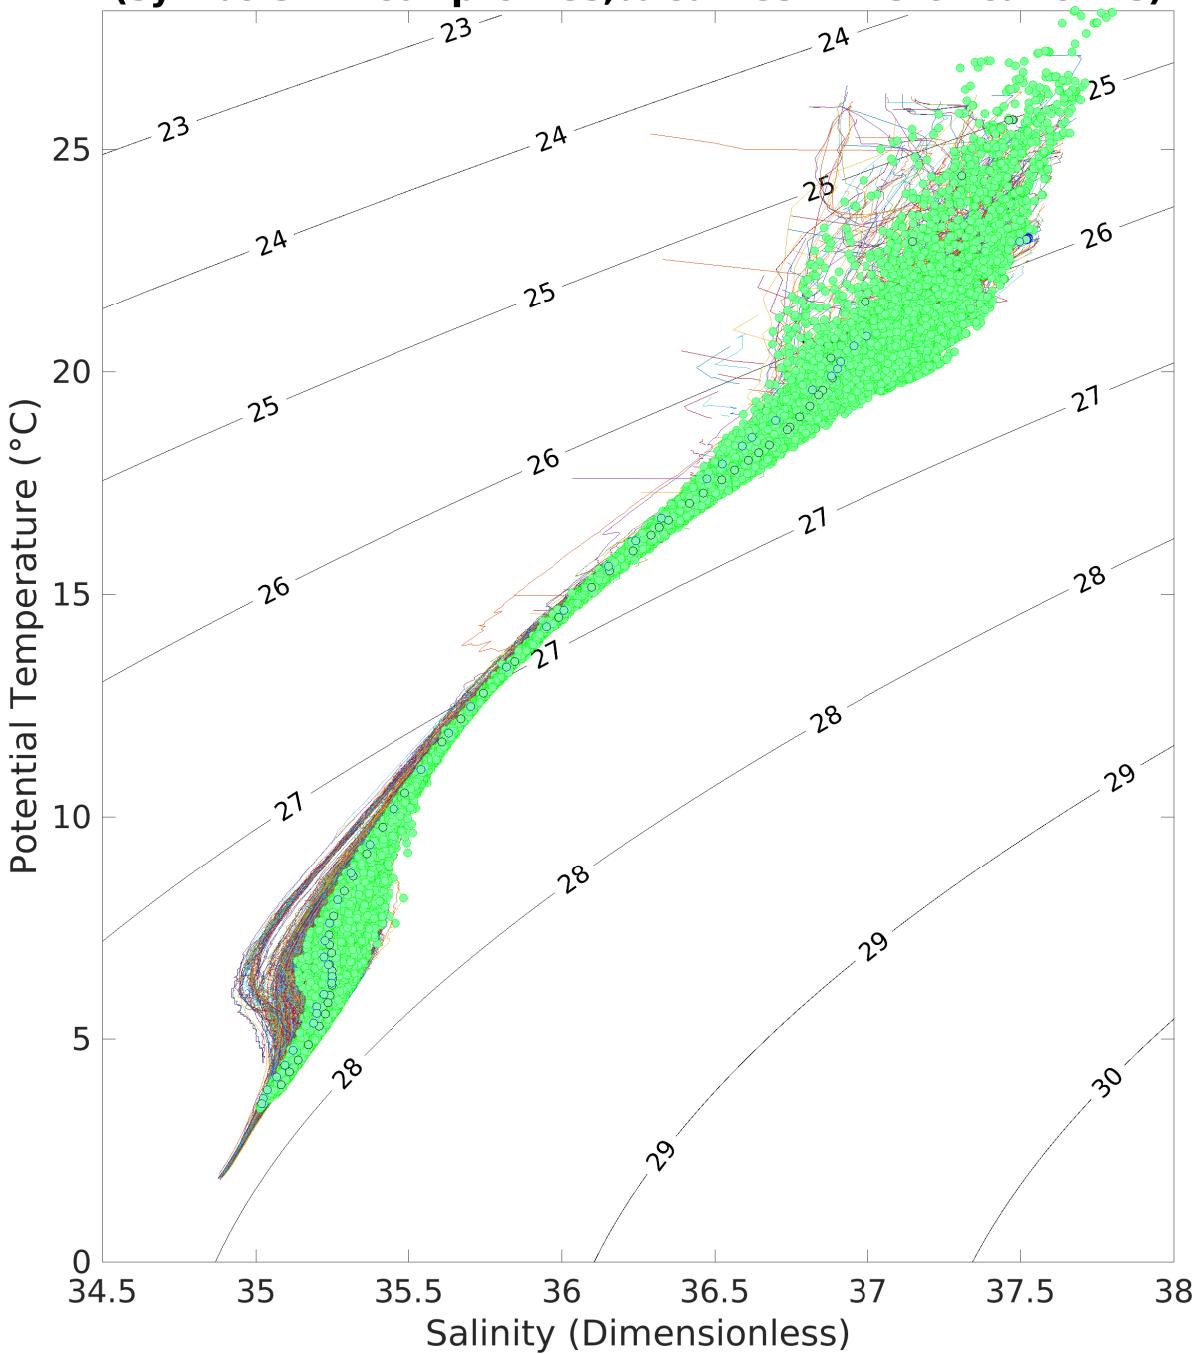

Figure 6: Float 6901121. T/S diagram plotted with and data from WMO boxes of CTD reference data (CTD for DMQC 2019V01) +/- 10° of latitude and longitude. The black and blue cycles indicate the first and the last Argo profile, respectively. Green symbols represent other Argo profiles from this float.

3 Pressure Adjustment for APEX Floats

Float 6901121 is the Apex float, where the pressure sensor is not auto-corrected to zero while at the sea surface, hence the pressure data in Apex float have to be corrected during processing in delayed-mode. The procedures of adjusting sea surface pressure are described in Argo User's Manual, 2017

(<https://archimer.ifremer.fr/doc/00228/33951/32470.pdf>).

Raw surface pressure measured before descent (+0 dbar offset) for float 55669

pressure correction in green

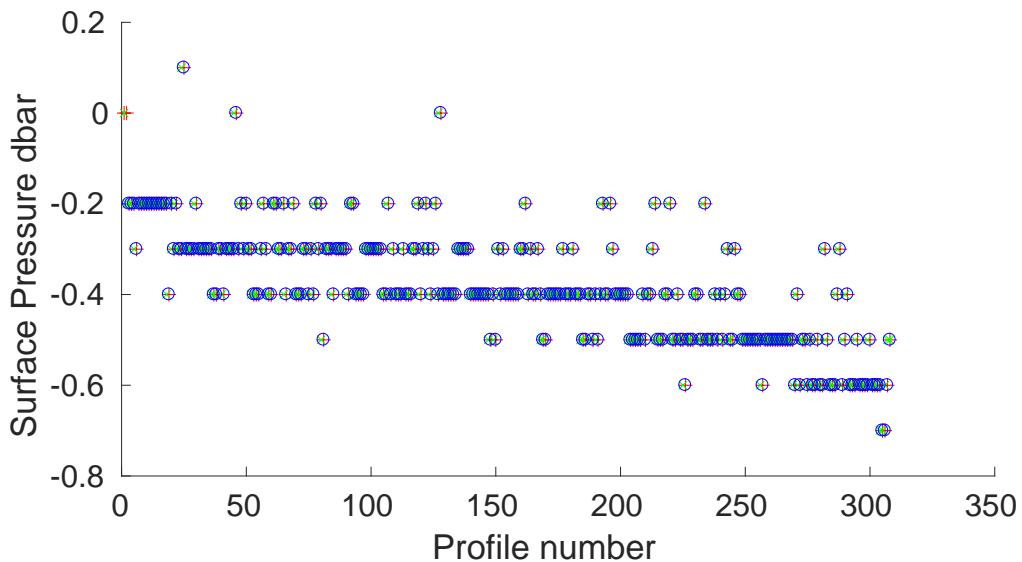

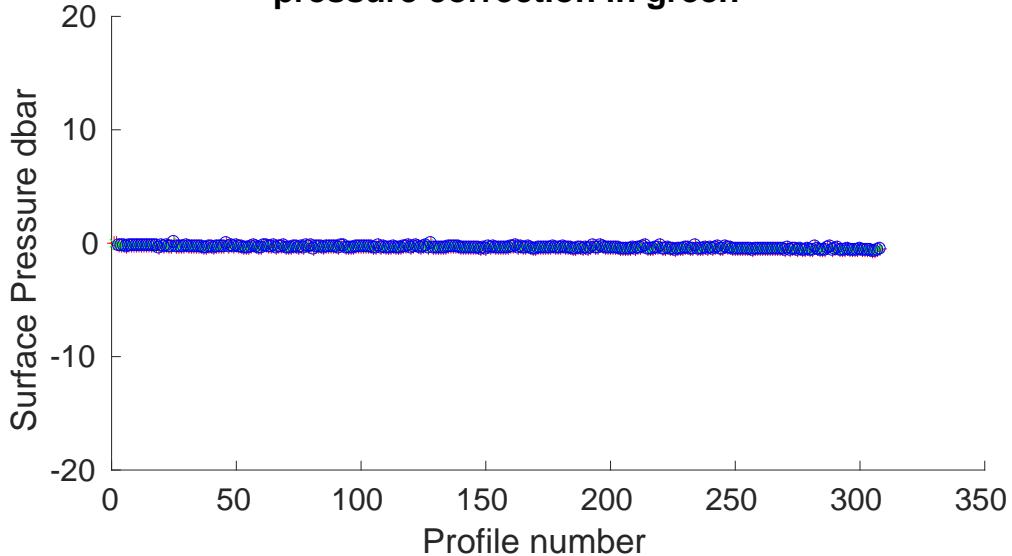

Figure 7: Float 6901121. Sea surface pressure data. The red cross indicate the raw pressure before float descent, recorded after sending data to GDAC. Blue circle indicate pressure value in the real-time. Green rotated cross shows the pressure correction applied from the previous float cycle. Top plot- data constrained between -20 and 20 dbar, bottom plot- data with the max range of data.

4.3 Summary and Conclusions

Float was deployed in the Cape Verde Basin and it propagated westward, toward the Mid-Atlantic Ridge. The OWC analysis has been run without setting any theta levels boundaries, then we run it for below 5 degree and between 11 and 15 degree, respectively. This report include results from the entire range of the temperatures. The OWC analysis showed an evidences of the salty drift, with intensification after around profiles 170. The OWC corrections has been applied for the entire float life, with QC=1 and error =0.005.
