Float decision

The pressure sensor propagate well with QC=1, err= 2.4 dbar. Cell Thermal Mass corrections applied. Profile 1-50 QC=1, error=0.01. Profiles 51-115, QC=1, error=0.03. Profiles 116-154, QC=1, error = 0.02.

1 Introduction

Delayed mode analysis was performed for float number 154199 (WMO: 6901192) where salinity and temperature values were separately compared to nearby historical CTD profiles and nearby Argo profiles as a reference database. The OWC (Cabanes et al., 2016) method was run to estimate a salinity offset and a salinity drift. For more information about float 6901192 click on the following link: <http://www.ifremer.fr/argoMonitoring/float/6901192>

2 Quality Check of Argo Float Data

2.1 Satellite Altimeter comparison

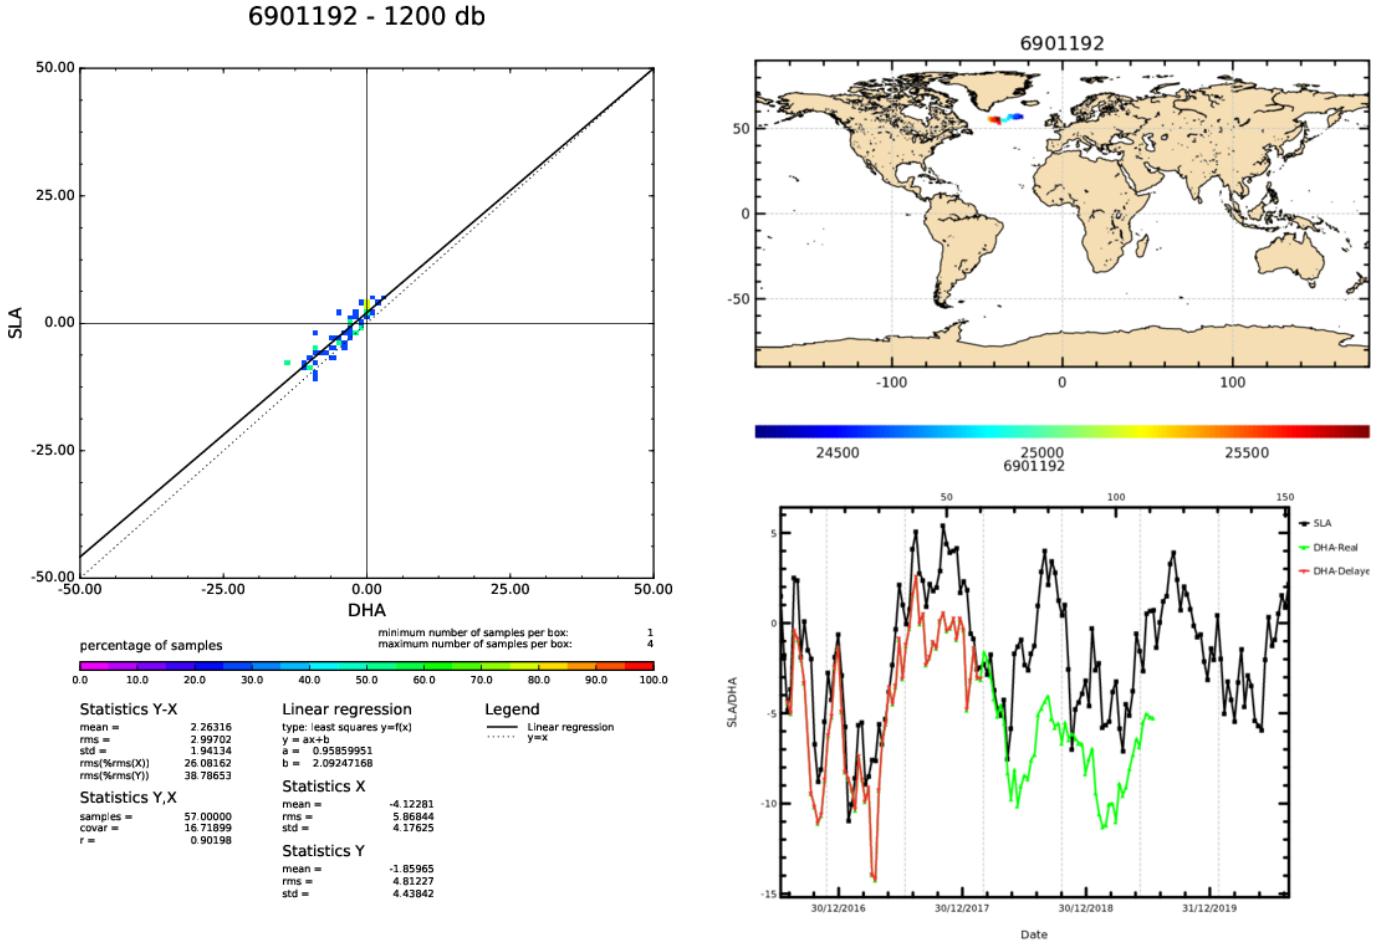

Figure 1: Float 6901192. The comparison between the Sea Surface Height (SSH) from the satellite altimetry and Dynamic Height Anomaly (DHA) extracted from the Argo float temperature and salinity data (<ftp://ftp.ifremer.fr/ifremer/argo/etc/argo-ast9-item13-AltimeterComparison/figures/>).

2.2 Time Series of Vertical Distribution of Data

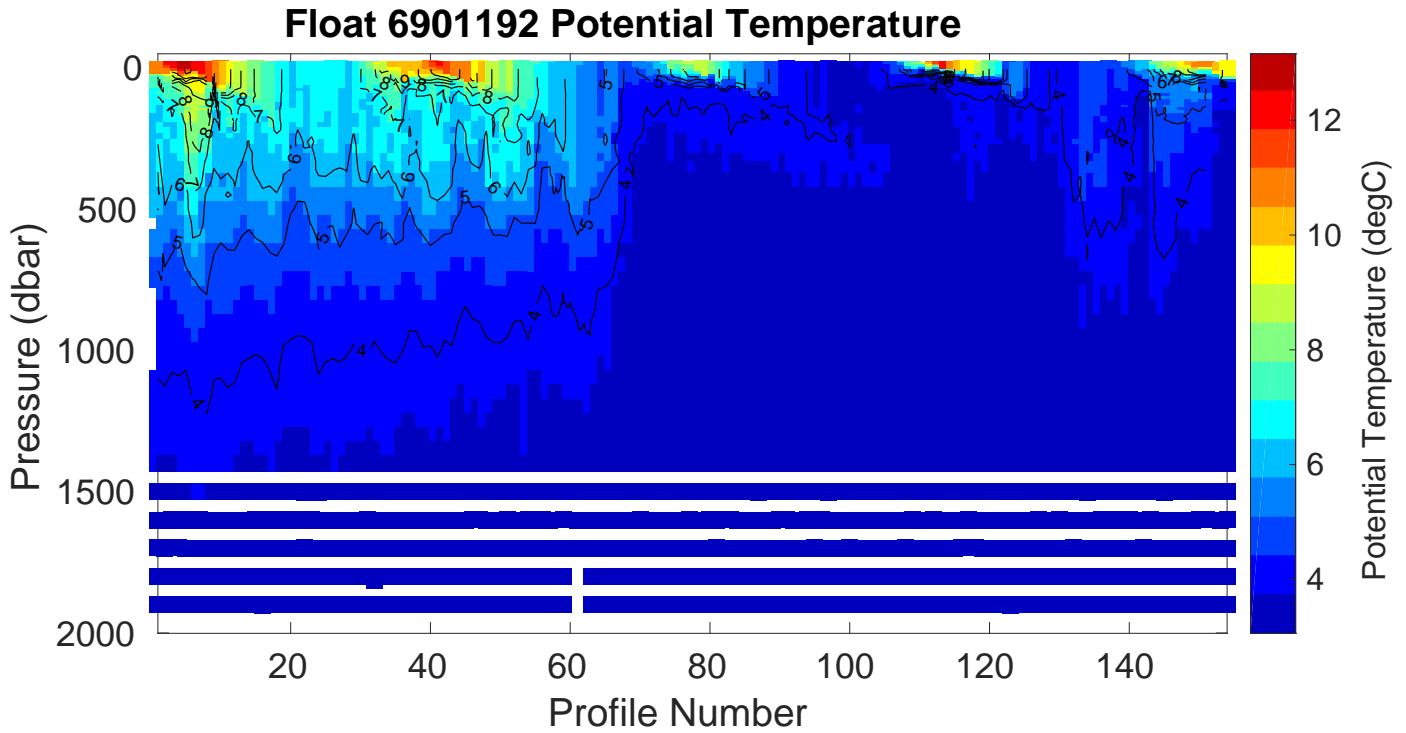

Figure 2: Float 6901192. Time series of the vertical distribution of potential temperature ($^{\circ}\text{C}$).

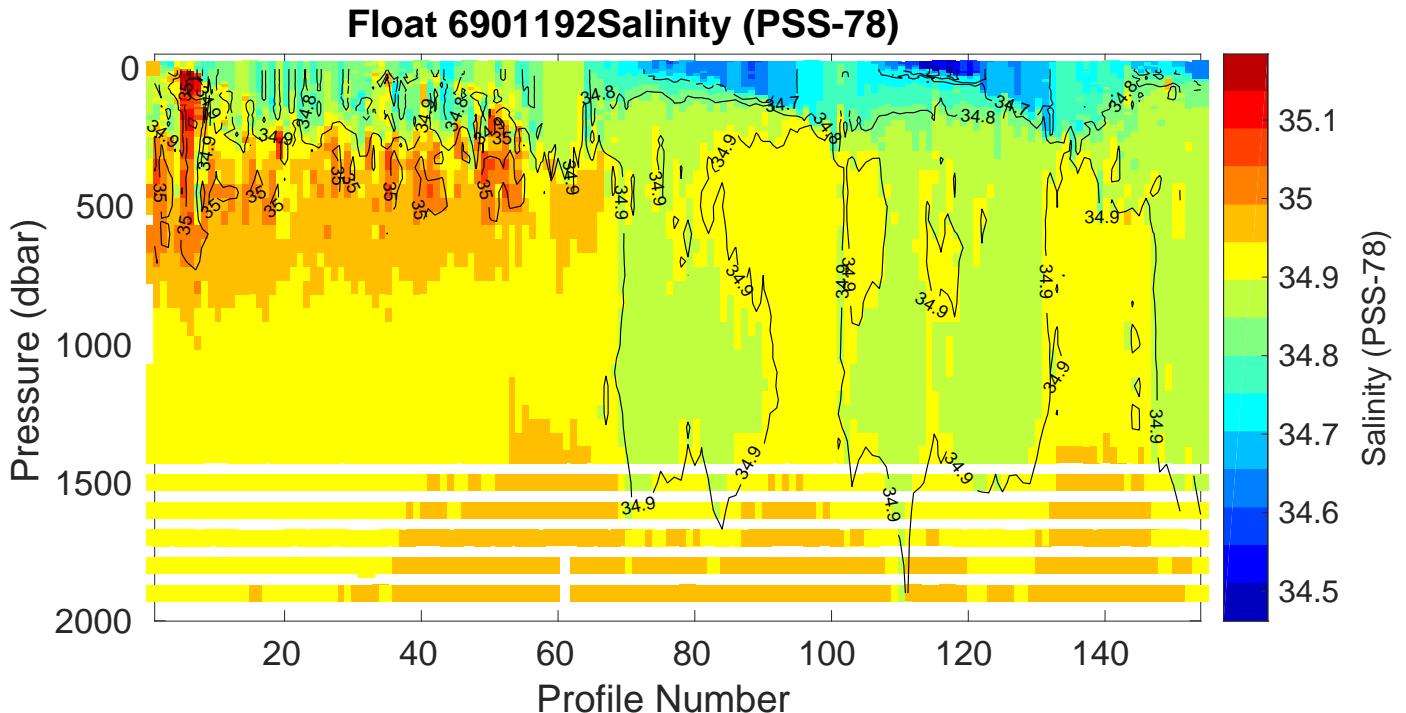

Figure 3: Float 6901192. Time series of the vertical distribution of salinity (PSS-78).

2.3 Comparison between Argo Float and Climatology

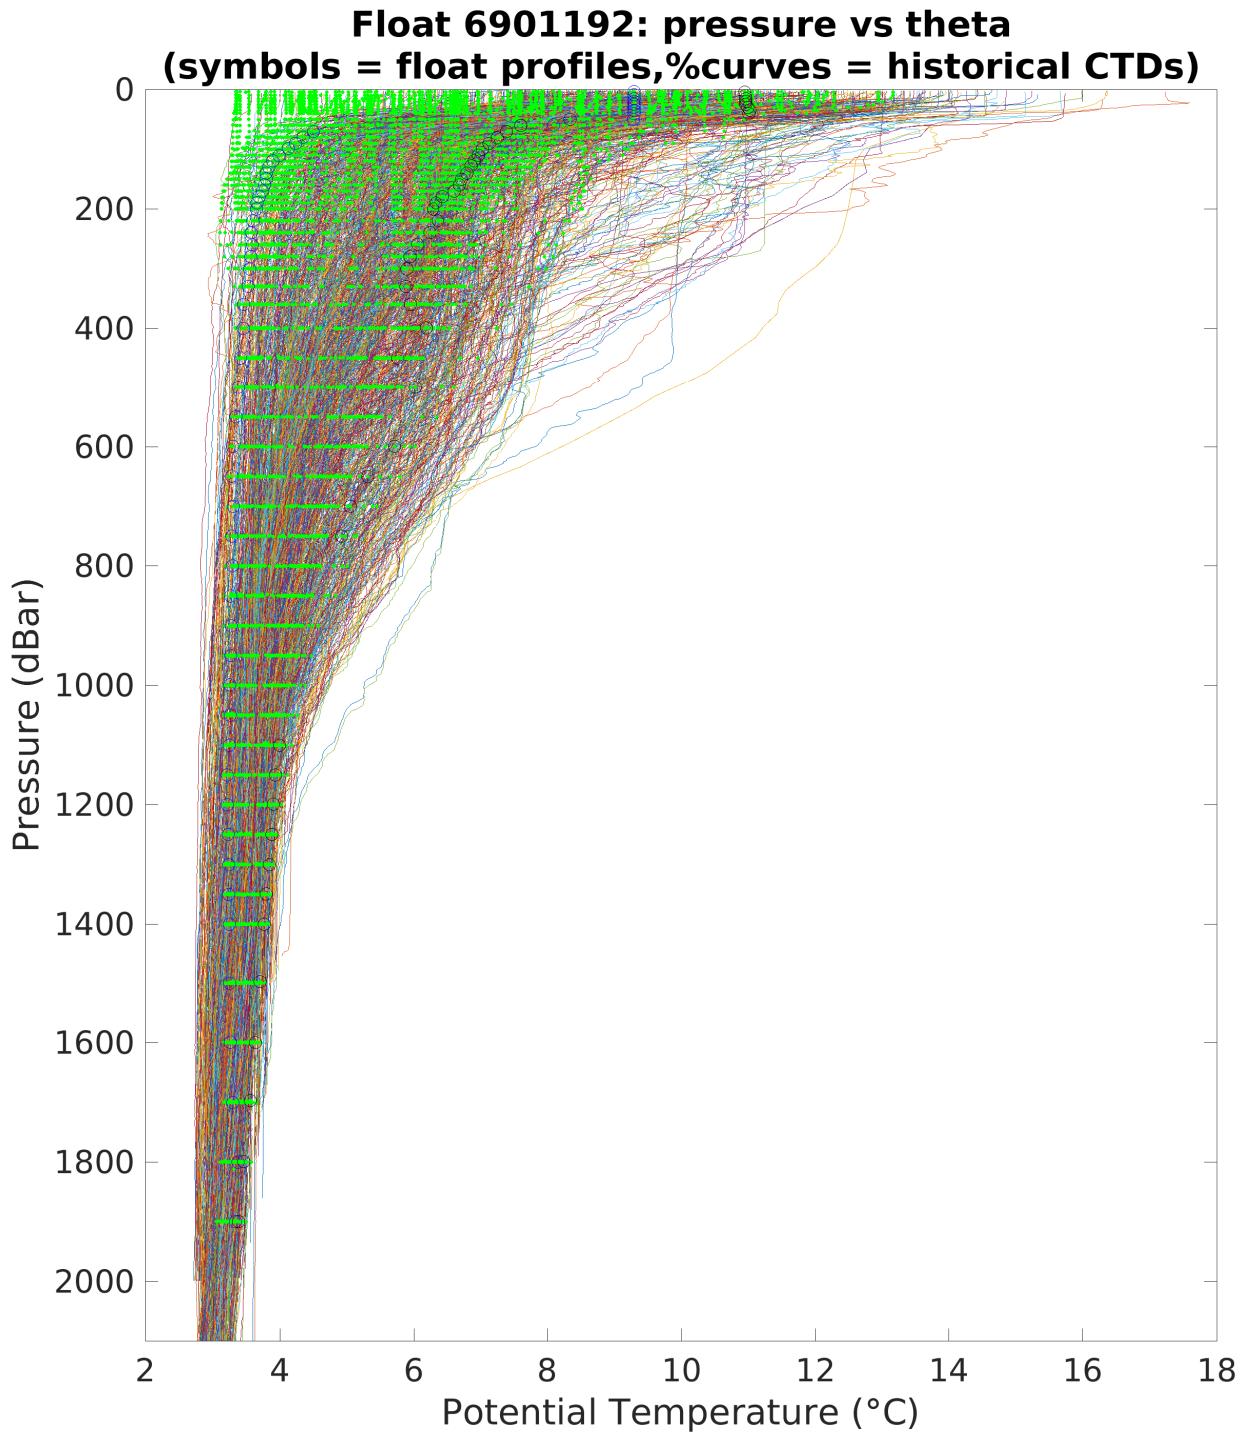

Figure 4: Float 6901192. Potential temperature ($^{\circ}\text{C}$) plotted with pressure (dBar) and data from WMO boxes of CTD reference data (CTD for DMQC 2019V01) \pm 10 $^{\circ}$ of latitude and longitude. The black and blue cycles indicates the first and the last Argo profile, respectively. Green symbols represent other Argo profiles from this float. The thin colors lines indicate the reference data

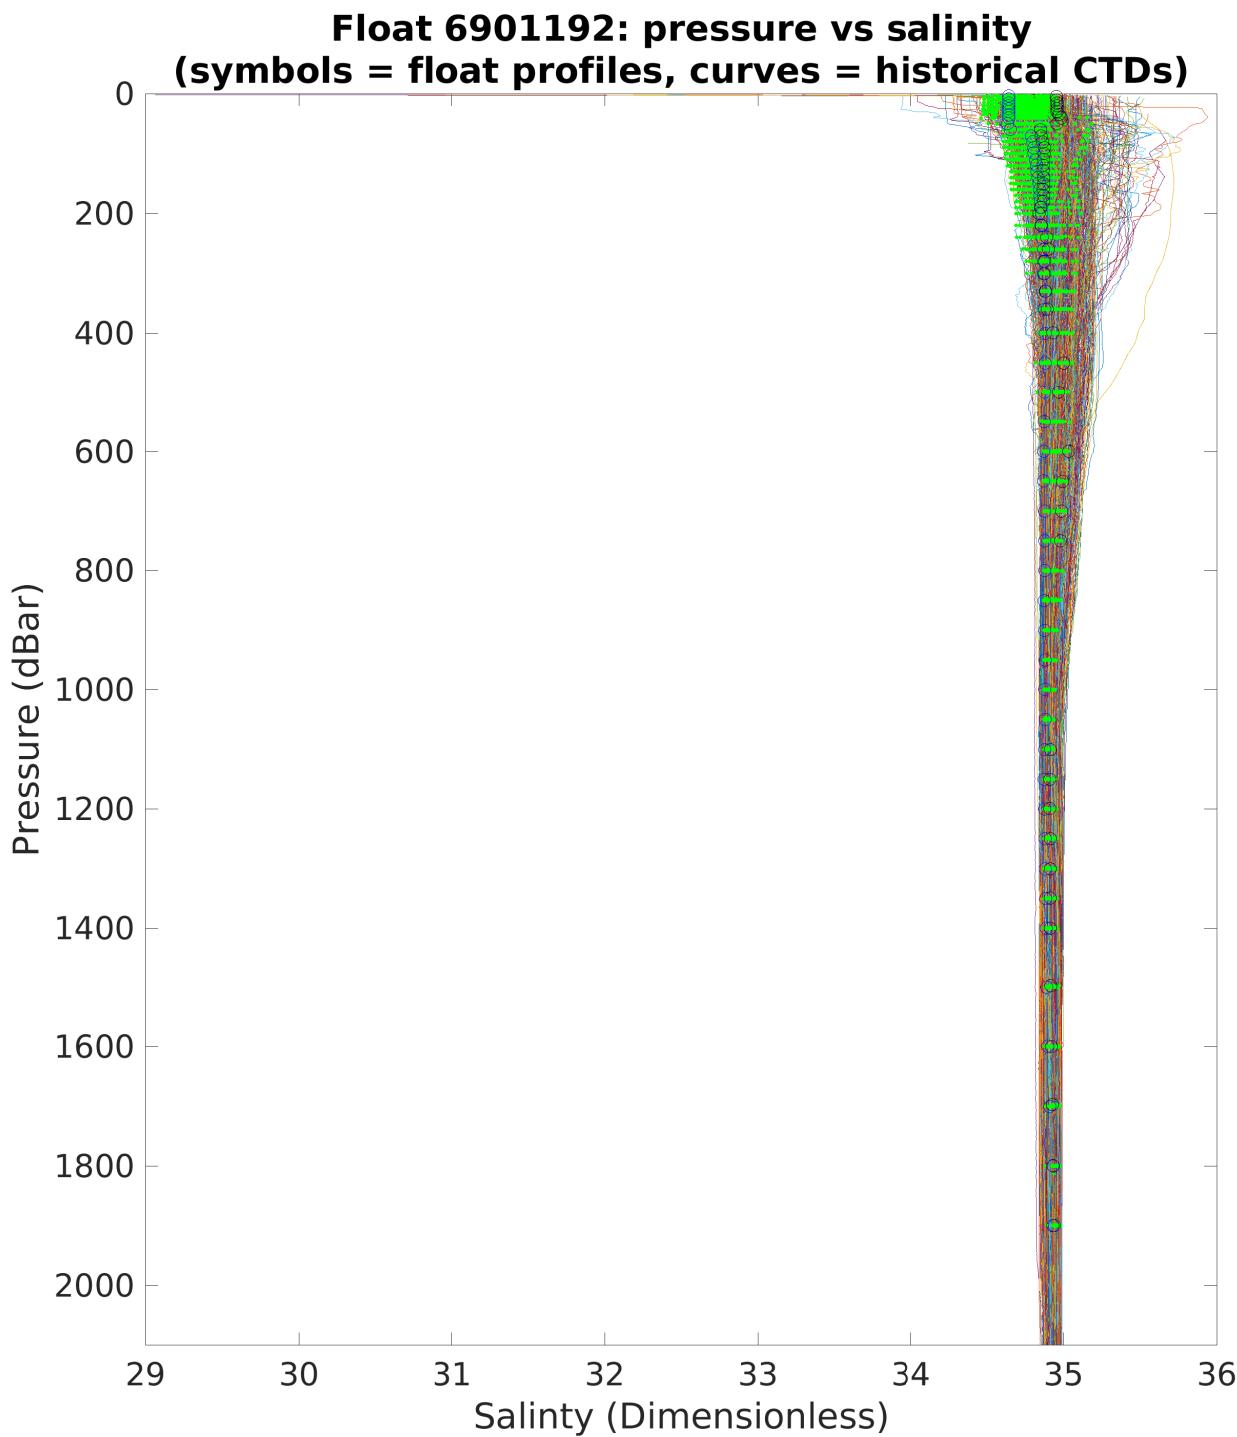

Figure 5: Float 6901192. Salinity (PSS-78) plotted with pressure (dBar) and data from WMO boxes of CTD reference data (CTD for DMQC 2019V01) +/- 10° of latitude and longitude. The black and blue cycles indicates the first and the last Argo profile, respectively. Green symbols represent other Argo profiles from this float. The thin colors lines indicate the reference data.

Float 6901192: theta vs salinity
(symbols = float profiles,% curves = historical CTDs)

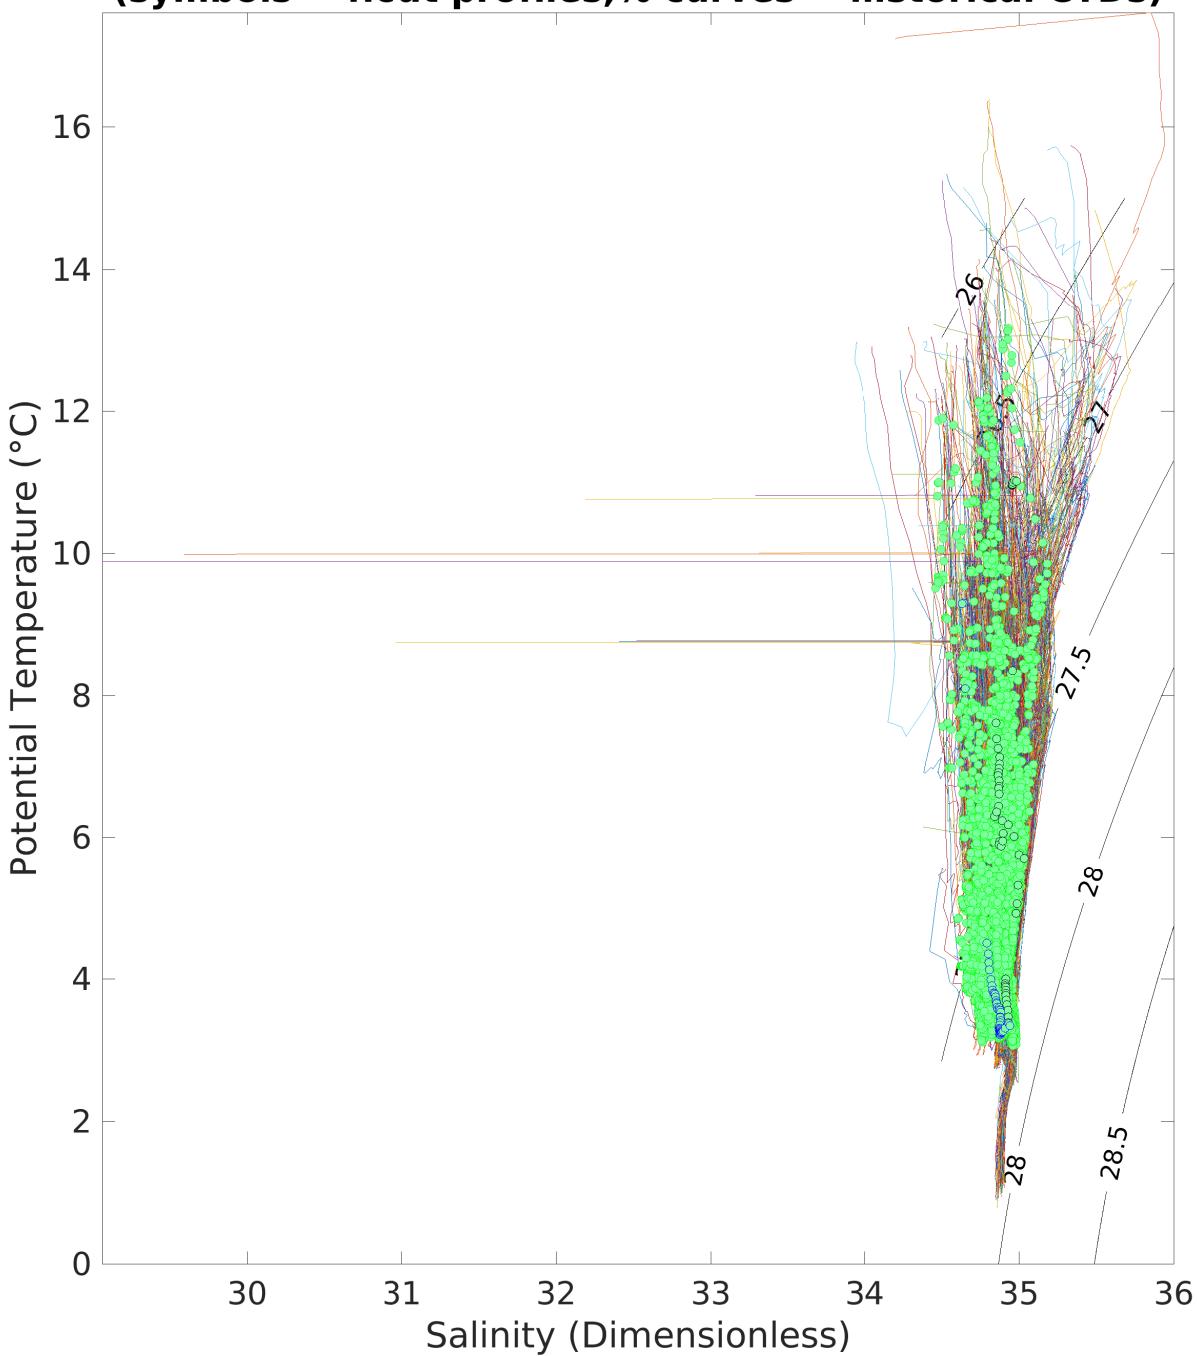

Figure 6: Float 6901192. T/S diagram plotted with and data from WMO boxes of CTD reference data (CTD for DMQC 2019V01) +/- 10° of latitude and longitude. The black and blue cycles indicates the first and the last Argo profile, respectively. Green symbols represent other Argo profiles from this float.

3 Pressure Adjustment for APEX Floats

Float 6901192 is the Apex float, where the pressure sensor is not auto-corrected to zero while at the sea surface, hence the pressure data in Apex float have to be corrected during processing in delayed-mode. The procedures of adjusting sea surface pressure are described in Argo User's Manual, 2017

(<https://archimer.ifremer.fr/doc/00228/33951/32470.pdf>).

Raw surface pressure measured before descent (+0 dbar offset) for float 154199 pressure correction in green

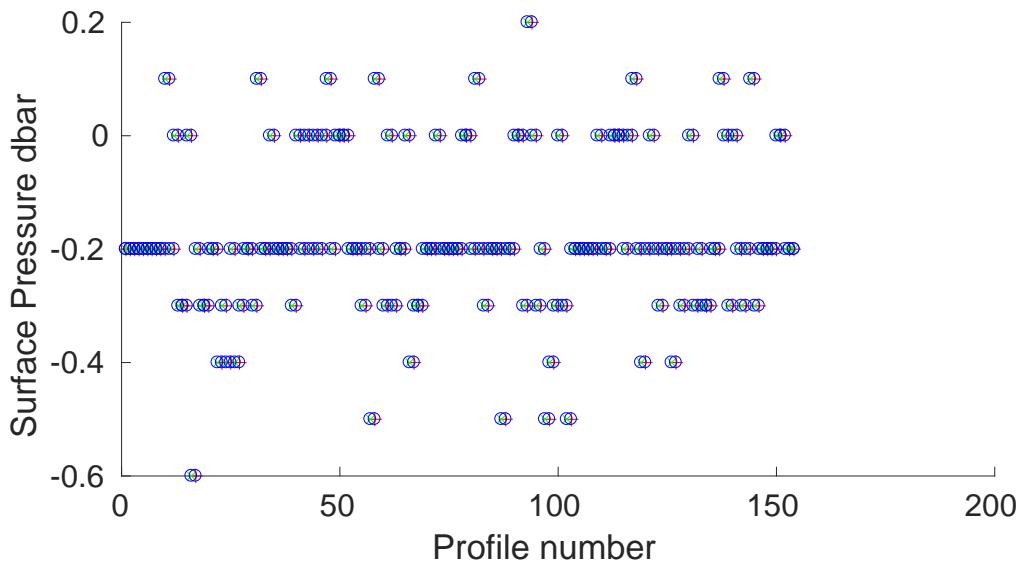

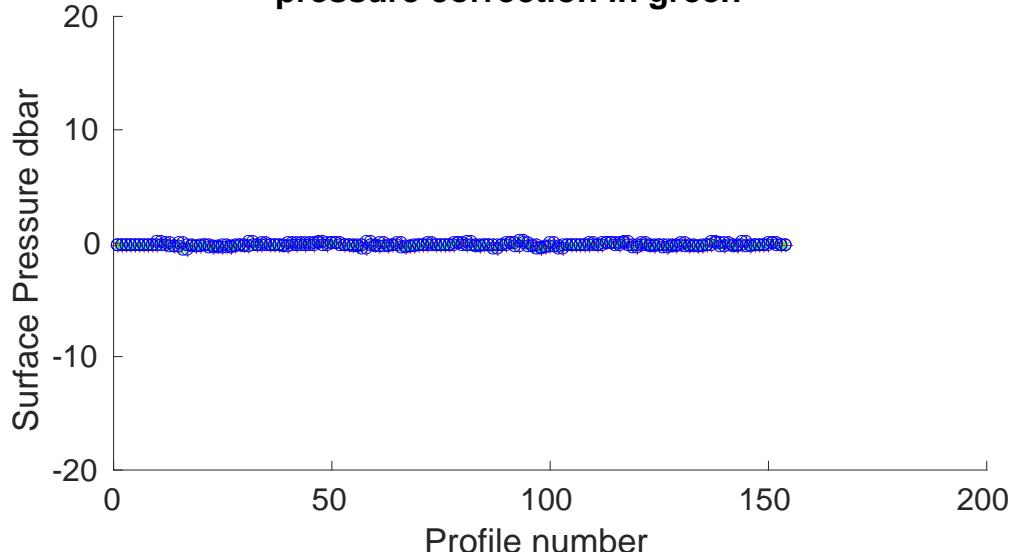

Figure 7: Float 6901192. Sea surface pressure data. The red cross indicate the raw pressure before float descent, recorded after sending data to GDAC. Blue circle indicate pressure value in the real-time. Green rotated cross shows the pressure correction applied from the previous float cycle. Top plot- data constrained between -2.4 and 2.4 dbar, middle plot- data constrained to -20 and 20 dbar, bottom plot- data with the max range of data.

4.3 Summary and Conclusions

This float was deployed in the North Atlantic at the eastern side of the Reykjanes Ridge. For the first around 50 profiles float was in the Iceland Basin, where further it crossed the Ridge to the Irminger Basin with a relatively different cooler and less saline water masses. Initially we were suspected drift after profiles 50 to 115, where salinity difference was in order of 0.035, but it more reflect high natural variability in this region. After around profile 115 float is reflecting much better fit to the reference data. The decision was to do not applying the OWC corrections for this float. Instead we increased error for profiles 51-115 to 0.03.
